Temporary Power Plant of Canadian Explosives, Beloeil, Que., showing two 15 H.P. Fairbanks-Morse engines driving generator.

# Fairbanks-Morse Service

**(The Best from Coast to Coast)**

## Canadian Explosives' Power Plant Started in Record Time

An accident to the main engine of the Canadian Explosives at Beloeil, P.Q., on Friday, Oct. 23rd, shut down the entire plant. A very serious matter considering the large orders on hand.

The Canadian Explosives Co. placed an order for two Fairbanks-Morse Oil engines complete with all the necessary shafting, pillow blocks, pulleys and belt to run their generator.

Within a very few minutes after the order was received the goods were on their way to the station, and arrived at 3 a.m. Saturday. At 10 o'clock the same morning the plant was ready for operations.

Put your problems up to our Engineers and keep your plant running full capacity.

We are prepared to equip your entire plant from power house to shipping room. Let us quote on your next requirements.

# Guns and Their Up-to-Date Development*

By Lt.-Col. F. M. Cole**

*Secondary only, if even that, to the interest in the manufacture of shrapnel and high explosive shells by our engineering plants, is that of the guns employed to discharge these and other type projectiles. The historical sketch forming the subject matter of this paper will therefore be found opportune, interesting and instructive at this juncture.*

BEFORE the invention of gunpowder, machines of various construction were used by the ancients to hurl projectiles against the enemy. They were principally employed against fortified places, and some of the machines were of huge size. The principal ones were the Catapult and the Ballista. The propulsive power in both was the elasticity of cords formed of the bowels of animals, sinews, human hairs and hemp, twisted into a spring that could be released by a trigger-catch. The Roman Ballista was the siege gun of the ancients. It was built in various sizes, the largest being powerful enough to hurl a stone, weighing 300 pounds, a distance of 500 yards.

### Gunpowder.

Gunpowder is supposed to have been invented by the Chinese long before it was known or used in Europe. If we go back nearly 600 years we find a representation in an illuminated manuscript made during the reign of Edward II. (1326), showing a knight in armour firing a short primitive weapon, shaped like a vase, loaded with an incendiary arrow.

Guns were at first constructed of wrought iron, and were made of large bore to fire heavy stone shot. The second epoch may be taken as dating from about 1520 to 1854, during which period cast iron shot were generally employed and the guns were made either of cast iron or bronze. They were much better proportioned than at the beginning.

The third or present epoch may be said to have commenced in 1854, when elongated projectiles and rifled guns began first to come into use. The rapid progress made during this period is as remarkable as the unproductiveness of the second epoch. Even during recent years the call for greater power has produced results which were believed to be impossible in 1890.

The early guns were made without trunnions. The huge gun, "Mons Meg," in Edinburgh Castle, has a calibre of 20 inches and fired a granite stone weighing 320 pounds. The gun was built up of

ORDNANCE, B.L., 60-PR., MARK I.

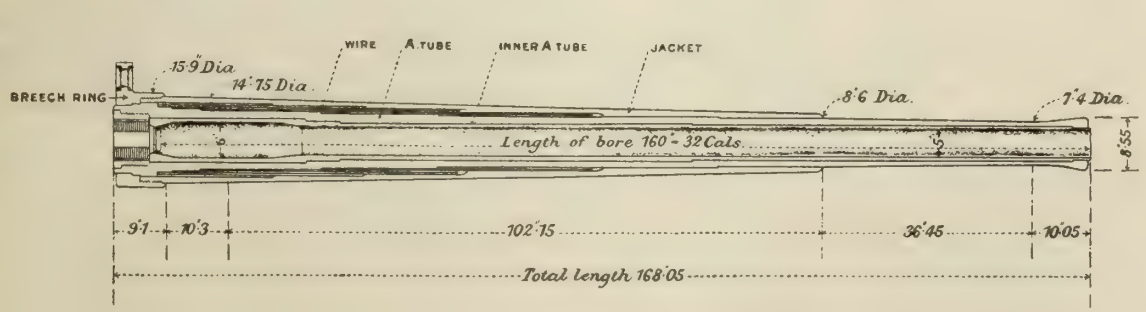

Plate I.

wrought iron longitudinal bars arranged like the staves of a cask and welded together, with external rings of wrought iron driven or shrunk on.

### Bronze Guns.

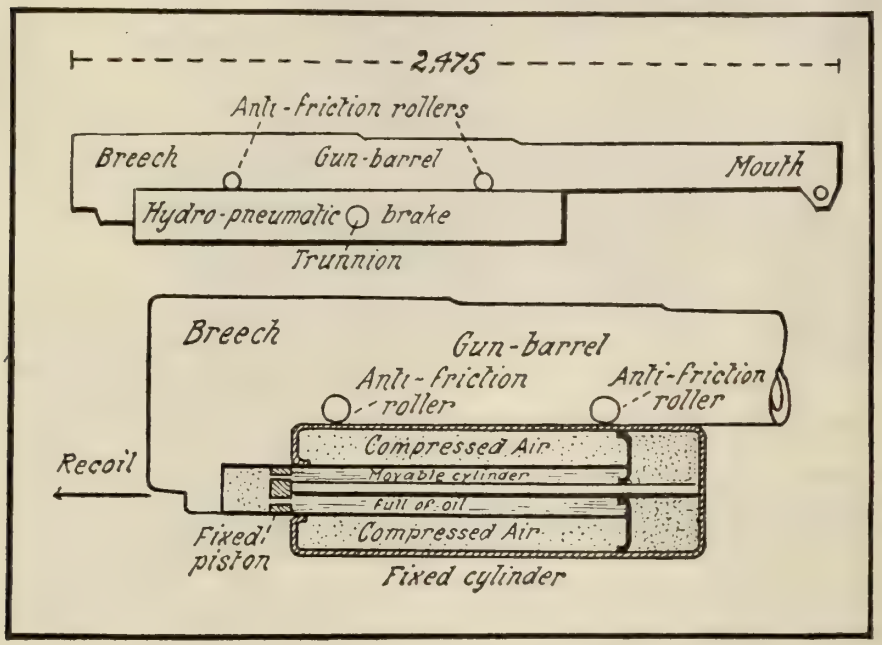
Bronze guns of about the same dimensions were cast about 1468 at Constantinople. One of these is now in the Royal Military Museum at Woolwich, a most interesting place, containing samples of the ideas of inventors for generations, and after my first visit to the museum I came away fully convinced that there was nothing new under the sun.

Some of these old guns at Constantinople were used against the British squadron, under Admiral Sir John Duckworth, who forced the Dardanelles in 1807. In this engagement, six men-of-war were damaged and some 126 men killed or wounded. The guns were too unwieldy to lay for each round, and were consequently placed in one position bearing on a strategic point and sometimes kept loaded for months.

The guns referred to were muzzle-loaders and were fired by means of a vent in the breech into which loose powder was poured from a horn. There are guns stored to-day at St. Helen's Island, Montreal, each with a powder horn and an iron rod known as a port-fire as part of its equipment. In the end of the rod was inserted a slow burning composition, which was kept alive as long as required; this touching the vent when the order to fire was given.

### Gun Definition.

The word gun is a general term for a weapon, tubular in form, from which a projectile is discharged by means of an explosive. In time it has come to be restricted to the heavier weapons used by artillery as distinct from small arms. When applied to artillery, the word is confined to those pieces of ordnance which have a direct as opposed to a high angle fire, in which later case the terms howitzer and mortar are used. Gunnery is the science of directing a projectile so that it will strike a given target.



DETAILS OF THE HYDRO-PNEUMATIC BRAKE OF THE "75."

The gun serves two purposes. First, to confine the powder gases so as to allow them to act upon the base of the shell; and, second, to give the shell the proper direction. As the powder charge burns, it is converted into gas of greatly increased volume. This gas, in its endeavor to expand, presses upon the base of the shell and drives it up the bore. So long as it continues to exert a forward pressure upon the base of the shell, it continues to accelerate the motion of the shell, and the latter goes on increasing until it passes out of the muzzle, and the pressure on its base ceases.

### Capacity of Gun.

Colonel Bethell, of the Royal Artillery, who is an authority, puts it thus:—

"We should get the greatest possible effect out of a charge of powder if the gun were made long enough to contain the whole of the powder gases, so that the forward pressure on the base of the shell would cease just as the shell reached the muzzle. Such a gun would, however, be unwieldy, and in practice we cut the gun short and allow a good deal of gas pressure to go to waste out of the muzzle."

The efficiency of any weapon depends entirely on two factors:—1—Its power to destroy men and material: 2—the moral effect of gun fire, which is of great importance. When guns were first used, the noise they made on discharge must have produced a bewildering fear in those without previous experience of them. Villani wrote of the battle of Cressy that the "English guns made a noise like thunder and caused much loss in men and horses."

Foreign founders were brought to England about 1540 for the purpose of teaching the English the art of casting guns. The "Mary Rose," which sank off Spithead in 1545, had on board both breech-loading wrought iron and muzzle-loading bronze guns. The long bronze gun in Dover Castle has a calibre of 4.75 inches and its total length, including the cascable (the part which projects in rear of the breech), is 24½ feet. This may be the gun which carries the inscription: "Load me well and keep me clean, I'll carry a ball to Calais Green." I do not think, however, that a projectile has yet reached the continent fired from any part of England. We know that our present enemies are desirous of experimenting from Calais with a view of dropping something more modern than round shot and larger than Zeppelin bombs on the Dover coast. The campaign, however, has not yet developed in the direction which would enable them to test their guns at this point.

Little or no classification of the various types of guns was attempted during the 15th century. The following century saw some attempt made at uniformity and the division of the several calibres into classes, but it was not until 1739, when Maritz, of Geneva, introduced the boring of guns from the solid, that actual uniformity of calibre was attained, as up to this date they were cast hollow and discrepancies naturally occurred. During the 18th and first half of the 19th century no change of importance was made. Better methods of manufacture had improved gunpowder and the windage between the shot and the bore had been reduced.

### Gun Equipment.

The earliest guns were not provided with sights or means for directing them, but this was not important, as the range seldom exceeded 100 yards. The direction for line was easily obtained by looking over the gun and moving the carriage trail to the right or left as was necessary. For elevation, an instrument was used later called a "Gunner's Quadrant." This was a graduated quadrant of a circle connecting a long and short arm forming a right angle; a line with a plummet hung from the angle in such a manner that on the long arm being placed along the bore near the muzzle the plummet hung down

against the quadrant and indicated the degrees of elevation given to the piece. Later on, tangent scales were used which fitted into sockets on the breech. These were used in conjunction with the dispart foresight and gave elevation up to 4 or 5 degrees over the top of the gun. When rifled guns came in, the holes for the tangent sight bars were inclined to compensate for the drift of the projectile.

The portion of the bore of a gun nearest the breech, which contains the powder charge, is called the chamber. The powder does not completely fill the chamber, nor is it a solid mass. If a charge of cordite were compressed into a solid block it would be found to fill only about one-third of the chamber. On ignition, the powder gases first fill the chamber, and more and more gas is generated by the burning of the charge until the pressure in the chamber overcomes the resistance of the driving band and the shell begins to move. This, in a field gun, occurs when the pressure rises to about 1½ tons to the square inch. Henceforward the powder pressure acts as an accelerating force upon the shell till the latter leaves the muzzle.

### Pressure in Bore.

Forty years ago, the only explosive used in guns was coarse black powder. The whole of the charge was converted into gas immediately on ignition, thus developing a very heavy pressure in the powder chamber, which rapidly fell as the shell moved up the bore. Guns of this period were, therefore, made of a very pronounced bottle shape, enormously thick at the breech. As an improvement, pebble powder was devised. This consisted of cubical grains of from ½ inch to 1½ inches. These burnt more slowly, giving less pressure at the start and a better maintained pressure as the shell travelled up the bore. Guns were then made thinner at the breech and thicker towards the muzzle.

Prismatic powder, pressed into large six-sided prisms, was the next step, and this was followed by slow-burning brown powder, known as cocoa powder. Now we have smokeless powder, in thick cords, tubes or tapes for long guns and fine strings for short ones. This has enabled us to adjust the pressure in the bore so as to get the maximum of work out of the gun with the minimum of metal.

The Armstrong system of breech-loading, introduced in 1854, was the first to give satisfactory results. It was simple in design and extremely accurate results were obtained in shooting. It took time, however, to screw and unscrew the breech. A later invention, the "interrupted screw," got over this difficulty and enabled the swinging block supported on a hinge to be closed and locked by a quarter turn. The breech screw is supported by a frame called the carrier pivoted to the breech of the gun at one side. Two other breech actions are in use on modern guns, namely—(a) the wedge, and (b) the eccentric screw. The former action is still a favorite in Germany, and has the merits of strength and simplicity. The latest British movable gun is now in the field in France.

### Sights.

The theory of the action of sights is simple enough when applied to the arc sight, which has superseded the old tangent scale, and the improvements in the accuracy and rate of fire of modern field guns have led to the introduction of more perfect sights. In all of these, the object of the improvements is to facilitate the layer's work so as to make laying easier, quicker and more accurate, and to avoid as far as possible the chance of mistakes.

Perhaps no adjunct of the gun shows such great improvement in recent years. It may be sufficient to say that the addition of the telescope and the attachment of the sights to non-recoiling portions of the carriage account to a large extent for the accuracy now obtainable, even at long ranges and with indirect laying. The term "indirect" is applied to the method of laying guns in which they are

FRENCH FIELD ARTILLERY FIRING BY "RAFALES" OR "GUSTS" WITH INCREASED ELEVATION. THIS METHOD SOON RENDERS AN ENEMY'S POSITION UNTENABLE.

not aimed upon the target to be attacked by direct vision.

**Indirect Laying.**

As a typical case, suppose the battery in action to be behind a hill, trees, houses, or other cover from view. The battery commander is posted sufficiently far to the front to see the target. From this point, known as the observing station, the battery commander directs his battery, either by telephone or by semaphore code.

In the present war there has been hardly any direct laying and the battery commander has usually been obliged to get a considerable distance in front of his battery to obtain a suitable observation station from which he communicates with it by telephone. It has been found necessary to have the guns completely dug in with a screen of some sort overhead in order to hide them from aerial observation. In the first part of the war, it was stated that 70 per cent. of the casualties among the Allies was due to artillery fire. I was present at Lydd, on the Kentish Coast, a few years ago for howitzer practice, and during night firing the average error of the guns—that is, the distance apart of the spots where the shells fell from the same gun fired at the same target, was less than five yards. To show the accuracy of the guns now in use, it has been stated that guns of the heavy artillery in recent actions in France have shown an average error of less than three yards.

**The Material Feature.**

Since 1880, the steel industry has made so much progress that this material is now regarded as the metal most to be relied on. The long high-power guns, however, require to be worked at a greater chamber pressure than the older breech-loaders. A stronger material than ordinary carbon gun steel was consequently demanded from the steel makers, in order to keep the weights of the heavier guns within reasonable limits. The demand was met by the introduction of a gun steel having about 4 per cent. of nickel in addition to about 0.4 per cent. of carbon. This alloy gives great toughness and endurance under a suitable oil hardening and annealing process, the yielding stress being about 26 to 28 tons and the breaking stress from 45 to 55 tons per square inch.

The 4.7 gun weighs 42 cwt., and is constructed of steel. It consists of an A tube, around a portion of which are wound successive layers of flat steel wire. The jacket is fitted over the exterior of the wire and a portion of the A tube, and is secured longitudinally by corresponding shoulders and the breech ring which is fitted over the rear end of the A tube and screwed to the jacket. The B tube is shrunk over the A tube in front of the jacket.

The 18-pr. Q.F. gun is constructed of steel, and consists of the A tube, a series of layers of steel wire, jacket and breech ring. The A tube extends from the rear end of the chamber to the muzzle. The weight with breech fittings is 9 cwt., and the length 97 inches. This is the gun of our field artillery.

**France's Pet Gun.**

The glory of the French artillery is the 75 MM. field gun, whose very existence was a jealously guarded secret until the war made concealment no longer possible. Thirty years ago the French artillery experts set to work to produce a gun which could duplicate on land the rapidity and accuracy of the Canet and Hotchkiss naval guns. It was understood that Krupps had undertaken the construction of such a weapon, and the French War Office sent for Major Deport, asking him if he could not invent a gun on the basis of a "long recoil."

**KNOW EVERYTHING—UNDERSTAND NOTHING.**

**"The Germans have at Berlin the most complete bureau of information to be found anywhere in the world. They know everything and understand nothing. They had no measurement in Germany to gauge the soul of a nation such as that of the British Empire," declared C. W. Barron, in his address before the Montreal Canadian Club.**

In a short time he submitted a field gun able to fire twenty-five rounds a minute. Its accuracy was perfect, and its stability was such that the two principal gunners could remain seated on the gun carriage during firing. Thus the "75," as it is commonly called, was born, and has proved to be everything the most exacting gunner could desire.

We all know what results have been achieved with the French field gun in the present war, and from all accounts our own 18-pounder field guns have proved an admirable and most satisfactory weapon. In its results, so far as we can judge, it is not far short of the French "75."

**British Modern Guns.**

The modern guns in use by Great Britain in the present war range in size from the 16 and 15-inch naval guns with which the "Warspite" and "Queen Elizabeth" and their sister ships are armed to the one-pounder quick-firing guns used on shipboard, as well as for land defences. I am not referring to the machine guns which are attached to every infantry unit. A diagram in a recent illustrated paper showed that a ship of the "Queen Elizabeth" class could from a point in the English Channel south of the Isle of Wight fire directly over the island and across Southampton water and drop shells in the town of Southampton, a distance of twenty-five miles. In the two days' battle of Neuve Chapelle, in which our own field artillery participated, 500 guns were in action on the side of the Allies.

## INCREASING THE OUTPUT OF MUNITIONS.

AS is well known, the doing of repetition work on machines not made for it can very often be immensely facilitated by contriving suitable appliances, in the shape of jigs, chucks, fixtures, punches, clamps, drills, cutters, grinding wheels or gauges, and by discovering quick ways, methods, and sequences of performing the necessary operations.

Just now, says a writer in the "Manchester Guardian," every other machine shop in the land is wrestling with the problem how to adapt machine tools originally made for general work, or for special work of a different nature to the manufacture of munitions, and each shop is having to discover the various kinks for itself to the best of its unaided ability. This is not only a needless reduplication of labor, but also a serious impediment to production, for the contrivers of first-rate kinks and tip-top methods are not to be found in every shop, and the average shop has perforce to rub along with the fair-to-middling appliances of its own devising.

In a great national task such as this, the best should be the common property of all. The new Committee on Munitions would do well to send a Commissioner round all the best general shops engaged on ammunition work, shops that have had some months to get into their stride, with instructions to find out and set down in detail, with drawings and photographs, every helpful device or practice that has been arrived at, and his report should be issued confidentially, with as little delay as possible, to every firm engaged on Government machine tool work.

The trouble and expense would be insignificant: there are no difficulties and no possible objections, while its helpfulness would be inestimable. If the responsible authorities will carry out the suggestion we are confident that a substantially increased production must ensue.

Shipbuilding steel contains about ¼ per cent. of carbon.

Every torpedo carries a certain quantity of ballast to keep it in an upright position.

# PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

## CHECKERED FINISH OF CASTINGS.

By D. A. Hampson.

THE checkered finish on the cast iron heads of squares and other tools serves a dual purpose. It looks nice and its very unevenness blinds the eye to little imperfections in the iron that would otherwise have to be covered up by filling, etc.

It is sometimes desired to make such a finish on a special job, but the evident cost of cutting all this on a pattern prohibits. A cheap and effectual way is to cover the surface of the pattern with a piece of leather having the right "grain." Another way, though not quite as good, is to cover with wall paper of this pattern; wall paper of this kind usually has a large figure, more like that in imitation alligator skin products.

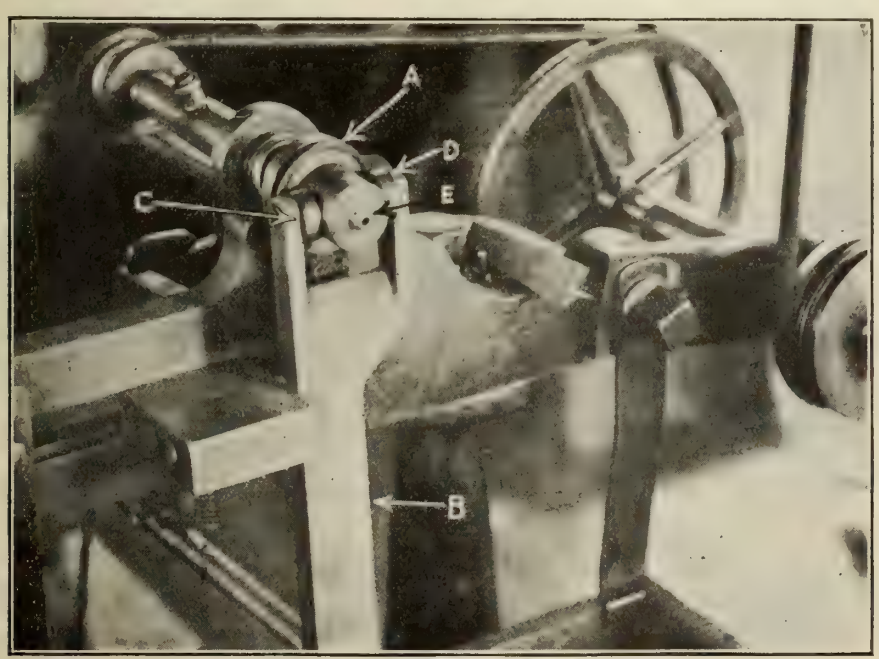
## POLISHING SCREW HEADS.

By A. E. Granville.

ROUND screw-heads are generally a considerable bother to polish, as ordinarily they must be handled individually. There are some automatic polishing machines for this purpose but they are not in general use.

The machine shown was made in a shop turning out round head screws in considerable numbers. The spindle runs at high speed and the split collet opens outward and is fastened to the spindle. The closing ring is pressed outward by a spring, so that normally the chuck is closed when running and is only opened when the foot treadle is pressed.

The flange A is fastened to the closing ring and travels with the spindle, and the forked lever B carries two rollers C and D which press against the flange and force it back when the foot treadle is used. As the closing ring or sleeve is pressed back, centrifugal force spreads the jaws and allows the polished screw to drop out. The operator then inserts another one, releases the foot treadle and holds a piece of emery cloth against the screw head. Only an instant is needed to finish the work.



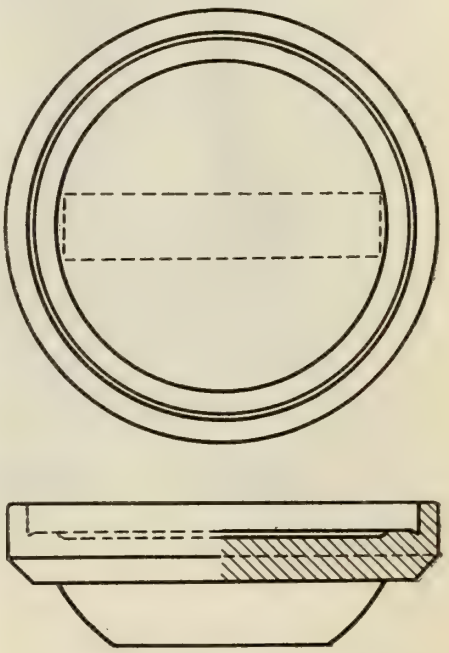
MACHINE FOR POLISHING SCREW HEADS.

## PISTON-RING HOLDING BLOCK.

A. L. Loy.

FOR holding piston rings while being filed or having other hand work done on them, a wooden block with several finishing nails driven into same to correspond to the proper circle is generally used. It is an impossibility, however, to obtain a block which is absolutely plane, and a much harder proposition to keep it so when in constant use. The nails also do not bear evenly on the outside of the ring and, to say the least, it is most unsatisfactory.

The block shown in the cut was made of cast iron, being turned out to a slightly larger diameter than the ring so that it could be easily inserted and removed. A lug was cast on the back to provide a handle and for clamping in a vise. The centre part of the block was relieved and a chip groove turned in the corner to care for any dirt or feather-edge on the ring. The depth of the turned portion was about three-quarters the width of the ring. This held the ring in a true position while being filed, and corresponded to the position which it took while in use in the cylinder.



PISTON RING HOLDING BLOCK.

Each assembler was provided with one of these blocks corresponding to sizes of engines built by him, With this, he was also given a cast iron block about ten inches square, similar to a surface plate, on which was pasted a sheet of fine emery cloth. This was used to true up the surface and take out the tool marks, or for dressing after filing. These blocks proved highly satisfactory to the assembler and a great deal of time was saved by having the proper sizes always at hand.

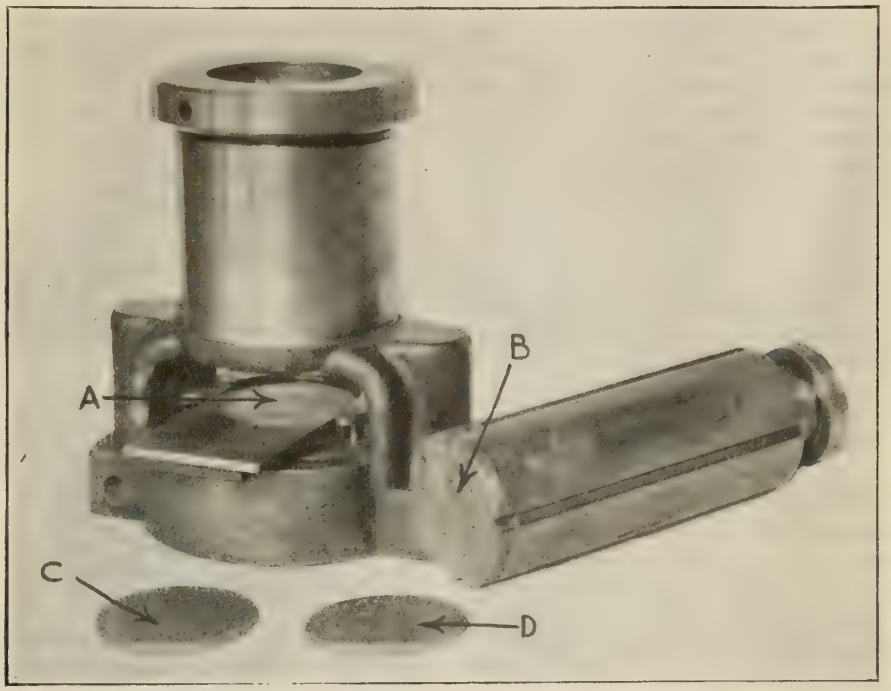
## SPOTTING WATCH PLATES.

By E. G. C.

MOST watch factories put their watch plates in jigs for spotting, by which is meant just running a small drill in far enough to give a through drill a start. Owing to the smallness of the drills used, it is never advisable to try to drill through a plate held in a jig, as the slightest clogging will break the drill.

The spotting of the holes in a jig takes considerable time, even if the girl operators do work at lightning speed. The Illinois Watch Factory, Springfield, Il-

linois, has for sometime spotted their plates in a punch press, using the type of subpress shown. The plate to be spotted is placed at A and the punch is brought down on it. The end of this punch carries a steel plate studded with small steel points as shown at B, just long enough to make the desired impression. A blank plate is shown at C and a spotted one at D. Spotted in this way, an operator can turn out dozens while one was being spotted in the old way in a jig.



SUB-PRESS FOR SPOTTING WATCH PLATES.

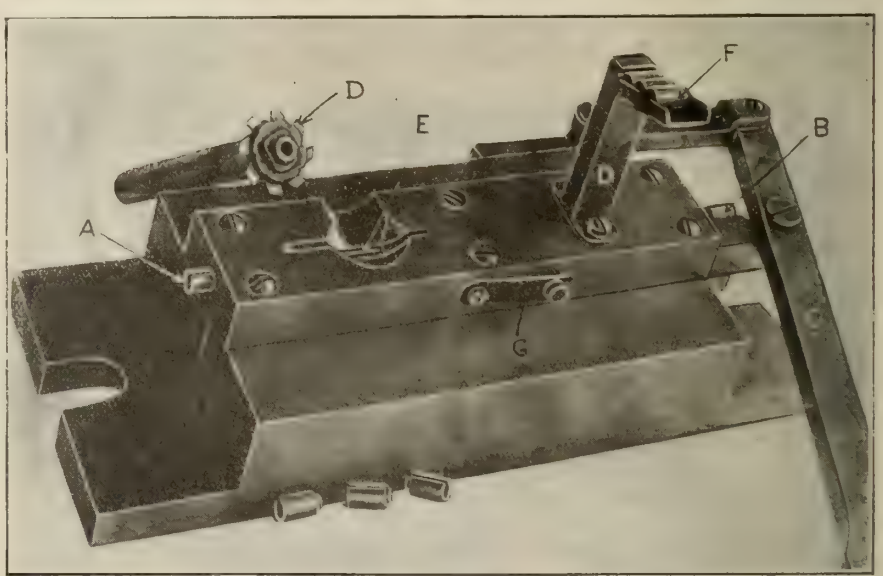
After the plates are spotted, the holes are drilled through, one at a time, and then each one is bored out accurately. This is done by placing the plate in a quill which centers one hole only, a separate quill or holder being provided for each hole to be bored. While this may seem a cumbersome method to the ordinary mechanic, it is the only way to obtain holes as accurate as are required in watch work at a reasonable speed. On some of the cheaper grades of watches, the holes are sometimes punched through, but this is not satisfactory and cannot be used for the better grades.

## SLITTING SMALL BUSHINGS.

By A. L. B.

A MAGAZINE fixture used for slitting small bushings is shown in the accompanying halftone. The fixture is bolted to the milling machine table and set so that the cutter D will work in the slot E deep enough to slit the bushings as they are fed under it.

The bushings are placed in the magazine chute at F and are pushed along through the hole in the fixture by means of a plunger B operated by hand-lever C. As they feed on past the cutter, they drop out of the end of the hole at A. The spring G backs a pin that projects into the long hole through the fixture. This pin is beveled toward the magazine so as to allow the bushings to feed forward but prevents any tendency to slip back after one has once passed it. Bushings can be slit as fast as the operator can conveniently work the lever. While this was designed for small bushings, it can easily be adapted to large ones which are to be slit on one side only.



FIXTURE FOR SLITTING SMALL BUSHINGS.

The gun shield of an ordinary field gun is about ⅛ ins. thick and the greatest distance at which a bullet will penetrate it is 600 yards.

## THE NEED FOR MUNITIONS.

WHEN the attack was delivered on Neuve Chappelle, says Sir John French, "our artillery completely cut off the village from German reinforcements by a curtain of shrapnel fire." In war as it is to-day, adds the Commander-in-Chief, heavy casualties are absolutely unavoidable. The power of defence conferred by modern weapons lengthens battles and wastes life, but battles can be shortened and loss lessened if an "absolutely unlimited supply of ammunition" enables attacks to be supported powerfully by artillery.

**Efficiency of Bath Lubrication.**—In the Alfred Herbert Co. Monthly Review for March appears a short article dealing with the efficiency of bath lubrication. It is pointed out that it is sometimes stated in machine tool catalogues that oil bath lubrication of gearing reduces frictional losses. This statement, the writer remarks, is easy to make but very difficult to prove. It is quite easy to demonstrate that the frictional losses in, say, a lathe headstock or gear-box are increased instead of reduced by oil bath lubrication. The writer is a strong advocate of oil bath lubrication, but not because it reduces the total friction losses, but because by its use the life of the machine is lengthened, the attention required is much diminished, and the possibility of parts seizing is practically eliminated. It is found in practice that when a gear-box having bath lubrication is run at high speed it will always increase considerably in temperature, owing to the internal friction caused by the churning up of the oil by the gears. By running the same box with the oil drained out, the temperature falls and the power is reduced correspondingly.

# EDITORIAL CORRESPONDENCE

Embracing the Further Discussion of Previously Published Articles, Inquiries for General Information, Observations and Suggestions. Your Co-operation is Invited

## TO THE READER, THINKER AND WRITER.

By H. Westwood.

THERE is nothing in the engineering profession of greater value than the columns of correspondence we read from time to time in our technical journals, and I would take the present opportunity of requesting from fellow craftsmen even more frequent communications. Let us have all possible ideas. Criticise everything that appears open to criticism and if experience has taught you different, give the public the benefit of your wisdom. The mere fact of you finding any difficulty in committing your knowledge to paper need be no drawback. The journal wants ideas, not words, and if the brain work is there it will be put into proper shape.

Every issue there is correspondence offering controversy, which many of us can doubtless indulge in. The modern newspaper is the substitute for the ancient forum. Instead of a number of people meeting in some public place, as they used to do to discuss various questions of interest, they now write to their paper and interchange their views through the medium of its printed pages.

I believe that there is no better way of acquiring and disseminating knowledge than to establish a co-operation between those who read and write, to place the opinions of practical men beside those of the theorist, the worker beside the thinker, and thus obtain news clearer, better and more comprehensive on subjects interesting alike to all.

## LAYING UP A HEATING PLANT FOR THE SUMMER.

By J. P. S.

THE approach of warmer weather means, among other things, that the fireman and, in some cases, the engineer must close up shop for the summer and hunt another job. To the transient and temporary man, the best manner of putting the plant and machinery away, is a matter of small moment, but to the lone man who stays on the job and is perhaps paid on the percentage of saving plan, the working condition of the plant for the next season is a matter of concern.

The treatment of the idle plant is important in that many vital parts, if neglected, deteriorate much more rapidly than when in use. The greatest destructive influence is, of course, corrosion and this is very hard to entirely prevent. The essential conditions for rusting or oxidation are dampness, air, and more or less warmth, and any means that will spoil this combination will achieve the desired end.

Steam and hot water plants necessarily require different treatments. In the case of a steam boiler alone, there are two methods of procedure. The boiler should be thoroughly cleaned and washed out in any case. It may then be very nearly filled with water, the remaining space being filled by a gallon or so of crude oil. The boiler may now be slowly drained and, as the water subsides, a coating of oil is left on all tubes and interior surfaces. The boiler is now sealed up as nearly air tight as possible.

The alternative is to fill the boiler nearly full of water, boil off the air, fill the boiler completely, add a little soda ash and seal it up. The outside parts should be cleaned of ashes, dust and particularly soot as the latter has a very strong attraction for moisture. Parts liable to rust should be painted with a good preventive of corrosion, and furnaces and building closed up. The top of the stack should be covered with a water-tight hood and all openings by which rain or other moisture may reach the boiler or breeching must be effectively closed. All external polished parts of brass or steel should be painted with vaseline or a mixture of white lead and tallow.

In the case of a steam heating plant as well as a hot water system, a difference of opinion exists among the best authorities. It has been shown, however by reliable tests that the average plant lasts from 15 to 20 per cent. longer when put away full of water. When doing this, the water should be boiled, if possible, to remove the air and more soda should be added when the water has not all been boiled. In the heating plants of high buildings, the head of water caused by filling the system may cause severe strains and consequent leaks in the lower pipes. Again, there is a continual danger of accident happening to the lower pipes during the summer with the result of flooding the building.

One of the best mixtures for painting smoke pipes, breechings and other parts after cleaning is ordinary boiled oil to which has been added enough good quality plumbago to give the consistency of a thin paint. This prevents rust, gives a good appearance and does not smell badly when the fire is started up.

Unfortunately the care given to a heating plant does not show immediate proportionate results. The conscientious engineer however, has the satisfaction of knowing that he is making easier the lot of the man who comes after him and may possibly be doubling the life of his plant.

## DYNAMO GENERATION FAILURE.

WRITING in the columns of Vulcan, Dr. Worrall says a dynamo will sometimes run quite satisfactorily day in and day out, but one time when it is required not a volt will it generate. The residual magnetism in the field magnets generate perhaps only five or ten volts when the dynamo is running at full speed, and this slight pressure causes a current to flow through the magnet coils, which increases the magnetic field and causes a greater pressure to be generated, which again increases the field current, and so on until the full pressure is generated.

If the resistance of the field circuit is much greater than the normal, the small pressure generated by the residual magnetism will be insufficient to excite the machine and cause the magnetic field to build up. The resistance may be increased by dirty or loose contacts, broken or cracked wire, perhaps inside the insulation, a dirty commutator, high mica in the commutator. The trouble may also be due to a reversal of the field connections. If the entire armature is short-circuited, the pressure generated by the residual magnetism will cause an internal current to flow in the armature, and none will flow through the parallel circuit of the shunt field. Various other suggestions are also made.

**Large Chain Drive Transmission.**—What is claimed to be the largest chain drive transmission in the world is installed in the Ox-Bow hydro-electric plant at Copperfield, Ore.. The plant consists of one 3,600 k.w., 3-phase, 60-cycle generator, running at 225 revolutions per minute, operated by two water-wheel units. Each water-wheel unit is connected to the generator by four Morse chains 21 in. wide, with sprockets of 2 in. pitch on the line shafting, and with shaft centres 10 ft. apart.

## THE PERISCOPE ON MODERN SUBMARINES.

THE submarine is perhaps the most complicated type of war vessel that exists, depending, as it does, upon the complete success of quite a large number of instruments and machines. Not the least important of these is the means by which those in control of the vessel are able to see practically all that goes on at the surface when the boat itself is submerged. The periscope in principle is not particularly complex, since it will readily be seen that it only needs a proper arrangement of mirrors in order that a fairly successful means of seeing objects on the surface of the water should be provided. Yet there are many difficulties in the way of the construction of a really good periscope, for the conditions under which it has to work are not the most favorable for optical success.

### The Periscope in Service.

In the first place, the boat has to be completely submerged, and the top of the periscope containing the top lenses and mirrors must, of course, be slightly above the surface of the water. This is a necessarily long instrument, relative to the diameter, and the total length of the tubular part is usually in the neighborhood of 15 to 17 feet. It is very desirable, for objects to be clearly seen by the observer, that the diameter of the tube should not be large, and, externally, it is commonly from 3 ins. to 6 ins. in diameter.

As may be imagined, a tube of this length and such a small diameter is weak, and when it is considered that the boat may be travelling under water at a speed of about 12 knots the pressure of the water naturally tends to prevent the satisfactory operation of the periscope, owing to the possibility of the tubular part of the periscope binding in the stuffing box, in which it slides, this stuffing box being provided to avoid water entering into the submarine. Further complications are introduced by the necessity of the observer to estimate the distance of the object from the submarine, and there are various other factors that have to be provided for, as mentioned later.

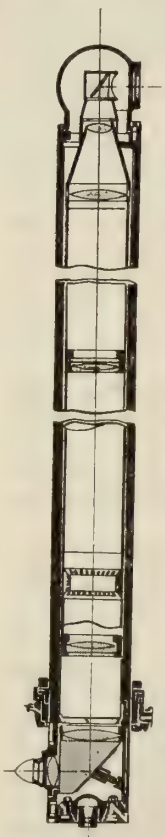


FIG. 1. SECTION THROUGH AN ORDINARY TYPE OF PERISCOPE AS USED ON MODERN SUBMARINES.

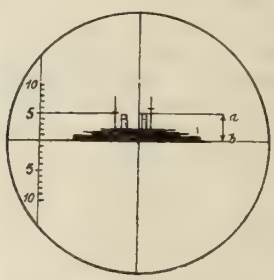

FIG. 2. A BATTLESHIP AS VIEWED BY THE OBSERVER THROUGH THE PERISCOPE IN A SUBMARINE, SHOWING MARKS FROM WHICH THE DISTANCE CAN BE JUDGED.

### Principle of the Periscope.

The principle of the periscope can be followed from Fig. 1. There is a prismatic lens at the top through which the rays of light enter. These are reflected downwards through various magnifying lenses in the body of the tube, and again horizontally by means of another prismatic lens at the bottom; thence they pass through the eye-piece to the eye of the observer. These lenses in the body of the tube are magnifying lenses, and the degree of magnification is usually about five or six times actual size. It is found that with this increase it is possible for the observer to pick out individual details of the vessel, this being a desirable feature.

It is obvious, then, that at any one moment the section of the horizon that can be viewed through the periscope is limited, and arrangements have, therefore, to be made in order that the periscope tube may be turned so as to compass the horizon as far as possible. It is undesirable that this turning movement should be employed too much, and it is not uncommon in more modern submarines to have two periscopes, one of which always sights right forward. It can be seen that this is particularly ne-

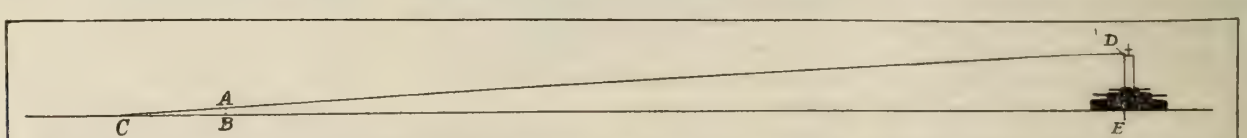

FIG. 3. SKETCH ILLUSTRATING PRINCIPLE OF FINDING THE DISTANCE OF A TARGET FROM THE SUBMARINE.

cessary in the newer boats, owing to the fact that they discharge torpedoes not only forward, but also aft.

### Periscope Turning Movement.

The turning movement of the periscope tube is carried out by means of a hand wheel, which the observer can, of course, operate without taking his eye from the eye-piece. Beyond this, provision has to be made in most submarines for raising and lowering the periscope tube with the stuffing box or gland, and it can well be understood that this may become quite a laborious business when the tube has to be extended nearly to its full range. If the submarine is in action, and awaiting its opportunity to torpedo any hostile vessel, the receiving prismatic lens has to be just above the level of the surface of the water. It may, of course, be considerably higher than this, but the greater length out of the water the more danger does the submarine run of having its periscope broken or damaged, when it becomes quite helpless under water.

In order to avoid the necessity of the observer moving the periscope by hand a small motor-driven winch is now usually fitted, although in some cases the motor is operated by compressed air or hydraulically. There is another interesting and perhaps somewhat unexpected appliance used in connection with the periscope, this being an exhauster arrangement consisting of a small electric-driven motor pump, by means of which the air in the periscope tube can be exhausted, passed through a drying medium, such as calcium chloride, and returned again to the periscope. This is necessary, as there is a natural tendency for the air in the periscope tube to become permeated with moisture, the dis-

WAKE OF A TORPEDO FIRED FROM A SUBMERGED SUBMARINE.
Cut, Courtesy of "Syren and Shipping."

advantages of which may hardly be explained.

### Ascertaining Line of Direction.

Another device that is necessary with the periscope is a means of ascertaining the line of direction of the view, without which it is impossible to tell exactly the course which will be taken by the torpedo when discharged. There is nothing difficult in arranging a gauge for this purpose, and in early submarines this was external to the periscope, so that the observer had to take his eye from the point of observation and note the bearing of the submarine on an instrument outside the periscope. This meant the readjustment of the focus of the observer's eye, with a consequent loss of valuable time, and the arrangement now adopted is to embody the indicator within the periscope itself, so that this is always in view of the man looking through the eye-piece.

### Finding the Range.

Although there is not the same importance in a submarine of knowing the distance of the target as in a larger war vessel, it is very desirable that the range should be known within a reasonable degree of accuracy. The rough principle for finding the range is illustrated in Figs. 2 and 3, although these do not in any detail represent actual measurements to scale, but are purely diagrammatic. In Fig. 3, B represents the position of the observer's eye, and it is taken for purposes of simplicity that he views the ship in the distance directly and not through the system of magnifying and prismatic lenses which actually constitute the periscope. Through the periscope he sees the height of the ship from the water-line to the top of the funnel represented by a distance ab (Fig. 2). If DE is the height of the funnel, then $\frac{AB}{BC} = \frac{DE}{EC}$. This ratio $\frac{DE}{EC}$ may, therefore, be expressed as a percentage.

VIEW OF SUBMARINE FULLY SUBMERGED, RUNNING AT 10 KNOTS AND SHOWING TWO PERISCOPES. Cut, Courtesy of "Syren and Shipping.

This is indicated in Fig. 2, which shows the target as viewed by the observer, where to the left are seen marks indicating the actual percentage. If, therefore, five per cent. is indicated, the height of the top of the funnel of the enemy ship above the water-line is five per cent. of the distance between the ship and the submarine; in other words, the range is 20 times the height of the funnel.

As the height of the funnels of all ships is known fairly accurately, the range can be gauged quite closely enough for all practical purposes. For instance, with a battle cruiser having the top of its funnel 80 feet above the water-line, the range in the case mentioned would be 1,600 feet.

The officer observing through the periscope is, of course, in charge of the whole ship, and has at hand not only the steering wheel, but also the speaking tubes to the engine-room and to the torpedo station.—Motor Ship.

## THE CHALLENGE OF THE LUSITANIA.

THE world's civilization rocks to-day, for while there are but few even among those of tender years who are unaware of the fact that "all that glitters is not gold," still fewer would have been prepared to affirm that Germany's role as a civilized power was but a veneer, and that things were not what they seemed relative to her heart and head. Whether the veneer has worn off, been rubbed off, or has fallen off, is immaterial, she is little abashed about it, even although history—sacred and profane—marks no blacker page than the tragedy of the Lusitania in its challenge to High Heaven.

Widespread, and in large part, silent indignation has been aroused the world over; in some quarters revenge and swift retribution have been demanded, and by still others the incense to war is being pressed with a vigor quite worthy of the abnormal circumstances. Much impatience is naturally being exhibited, and as is usual, even under less trying circumstances, it is in no sense justifiable. Germany in the past nine months has done more self-wrecking than the Allies with a triple backing could have even begun to accomplish and this feature need and should not be lost sight of under her most tantalizing dastardliness.

A rather determined effort is being made by Germany to inflame and involve the United States in the conflict, and, on the other hand, a much too great importance is attached to what might be expected of the active co-operation of that country in helping crush the terrorism. While the attitude of the American Government has not in any particular sense been marked by display of moral courage, its record up till now having been passive indifference on the one side and passive assistance on the other—a naval supremacy contributing, the development of the hour makes imperative on the high grounds of Christianity, humanity and a world freedom from tyranny and frightfulness, that whether passive or active assistance of the Allies be the future policy or not, indifference to its duty and neglect of its national and international obligations must cease.

No matter what the individual constitution of the United States be, the hour of its decision, of its destiny perchance has arrived, and while it need neither be looked upon as the ultimate saviour of the world's freedom by breaking off diplomatic relations with Germany and actively or passively assisting the Allies, accommodating neutrality must disappear.

We are not of those—and they are legion, figuratively speaking, who believe that the United States should be and need be participants in this European conflict. We are, however, of opinion that notwithstanding the Lusitania tragedy, that country has shirked taking the stand that as a Christian nation she has been called upon to take. As already indicated, Germany's retribution may or may not come through American instrumentality, whole or part; it will, however, certainly come, the up-to-the-present attitude of the United States notwithstanding.

The Lusitania will be avenged, and the direction and nature of the blow will neither emanate from Washington, London, Paris or Petrograd, although all or any of these may be the medium. The challenge to Christianity and humanity has been accepted, and will be met successfully. May the United States procrastinate?

## EDITORIAL NOTICES.

IN view of the fact that submarine warfare or to be more explicit, Germany's submarine hellishness has been recently brought so vividly and tearfully home to us by the torpedoing of the Cunard liner, Lusitania, we have devoted a section of this issue to a detail description of what might be called the feature equipment—the periscope, of these modern engines of war. Illustrations are also given showing the submarine immersed and the track of the discharged torpedo as visible on the water surface.

In our May 20 issue, the feature article will consist of an illustrated description covering the "Manufacture of Shells and the Brass Cartridge Cases for Same in a Prominent Canadian Railway Shop."

# The General Market Conditions and Tendencies

**This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.**

**Montreal, Que., May 10, 1915.**—Industrial conditions remain much as before, there not being much activity along lines outside of that connected with the manufacture of munitions of war. The critical events that are now being enacted in Europe have caused the crushing of all thought of launching new enterprises. However, the normal business of the country is being conducted on the soundest of financial principles.

The steel industry is rather quiet, although from time to time business from foreign countries and the overseas colonies of the Empire keeps cropping up, which shows that our institutions are alive to all opportunities that present themselves.

Machine tools are very quiet, except in lathes and grinders, which are in demand for shell making.

Metals are all going up in price, due to the activities in the war zone and other indefinable causes more or less directly traceable to war influences.

**Steel Trade.**

Recently the Algoma Steel Co. closed several orders for steel sections to be shipped to South Africa. It appears that this material was purchased f.o.b. steamer at Montreal, the purchaser looking after the freighting of the material. Shortage of tonnage makes ocean freights very high, and, in fact, practically prohibitive, and, were it not for

this serious obstacle, Canada could easily cultivate an extensive business with Australia and South Africa. There is every prospect with the lead now secured and the close of the war that the twenty million tons of steel that Germany exported will be divided among other countries and Canada is bound to receive her share. Steel for shells is more in demand all the time. Tool steel is also selling well.

### Pig Iron.

Pig iron continues quiet, and no activity need be expected until the war close.

### Machine Tools.

Canada's capacity for forging 18-pdr. shrapnel shells is 23,000 per day, and that for machinery amounts to 40,000 shells per day. The demand for tools, such as lathes, etc., is not, therefore, so great meantime as that for forging presses.

---

**Toronto, Ont., May 11, 1915**—There's little change to note in the general industrial situation this week. The weather conditions are satisfactory as far as the crops are concerned, which will help to create a more optimistic spirit in business circles. Prospects at present are very favorable. Although the total volume of business is hardly equal to the output last year, orders for war equipment continue to keep many factories busy. The firms engaged in the manufacture of munitions are increasing in number and the industry is developing in a satisfactory and creditable manner. There appears to be no prospect of relief in regard to the scarcity of ocean tonnage as so many boats have been taken over by the British Government for transport and supply ships. Since the sphere of military operations has extended to the Dardanelles the need for ships for military purposes has become more urgent. The shortage of tonnage will have a tendency to further increase freight rates and also delay shipment of goods.

There are indications of greater activity on the part of municipalities in various parts of the country and a number of civic improvements are being proceeded with. The volume of business, however, that is likely to originate from these sources will be considerably less than in the past few years owing to the financial situation.

### Steel Market.

Conditions in the steel trade are showing some improvement but the principal development is in the shell industry. The output of shell forgings is considerably less than the capacity of the machine shops. In order to overcome this deficiency, new presses are being installed in more than one plant, while in addition forgings are being imported from the States. There is a fair demand for structural shapes for bridge work, but the building trade is still quiet. A little better demand for merchant bars is reported but the total tonnage is comparatively light. Prices continue very firm, which is a favorable indication. Galvanized sheets have advanced 15c per cwt., due to the higher prices for spelter which have prevailed for some time, and which show no indication of weakening.

### Pig Iron.

The market continues in much the same condition and nothing of interest has developed. Buying is light and prices are unchanged.

### BUSINESS DECISIONS.

**Business, after all, has some sordid aspects, and all of us at times find it in line with our duty to make decisions which for personal reasons we would rather not make. Everywhere there is stiff competition, a sort of warfare, which has its temptations for the exercise of our most selfish and least admirable traits. Sometimes I think of business as a constant battle between heart influence and head influence. If the heart influence is too much, we may do an injustice to our business and to our stockholders. If the head influence is too much, we may do and injustice to the individual employee, or to our honorable competitors, or to the public. What we must have at all times is a fine mixture of both heart and head influence to the end that we will serve best those whom we work for as well as those who work for us, and those whom we serve, and by whose patronage we exist — the public.** — Hugh Chalmers.

### Machine Tools.

The shell business continues to monopolize the market and the demand for machine tools is very active. There is no improvement as regards deliveries, which is causing great inconvenience and also creating a good demand for second-hand equipment. There does not appear to be any prospect for a relief in the situation for some time to come, as machine tool builders are filled up with orders. A number of new concerns in the shell business are in the market for tools and their requirements are being met with difficulty. Inquiries for machine tools for 4.5 calibre shells have been received by local machinery houses and it is reported that 60-pounder projectiles will be made in this country.

### Supplies.

The supply business has improved considerably and local houses report very satisfactory conditions. The price changes to note are in glue and pure Manila rope. Glue has advanced 3c per pound on account of higher cost of raw materials and in the case of imported English glue, the increase in ocean freight rates. Pure Manila rope has advanced 1c per pound, due partly to a strong market and also to higher cost of raw materials.

### Scrap Metals.

Fine business is reported in copper and brass scrap but other lines are quiet. Prices are firmer and crucible copper, brass clippings and brass turnings have all advanced ½c per pound. Scrap zinc is 1c higher and is quoted at 8c per pound. Other prices are given in the selected market quotations.

### Metals.

The announcement is made that the Canadian Government has placed an embargo on the export of all metals to all countries with the exception of Great Britain and Allies. This will probably not affect the market to any appreciable extent, as with few exceptions, no large quantities are exported from Canada, and in some cases, are only imported. The general conditions are practically unchanged, the active demand for munitions continues, but business in other respects is quiet. The tin market is weak in New York but stronger in London. Copper is very firm but quotations are unchanged. The antimony and spelter markets continue to advance. Lead is firmer but quiet. The fear of a war between Japan and China has had a tendency to strengthen the London markets.

**Tin.**—The situation is unchanged and the New York market is irregular with a weak tendency. The London market is stronger but with little enquiry. Tin has declined 3c and is quoted locally at 45c per pound.

**Copper.**—The market is quiet but firmer, and quotations are unchanged. Production is increasing rapidly but so is the consumption, and will no doubt continue to do so for months. Lake copper is quoted locally at 21c per pound.

**Spelter.**- The market is firm and advancing. Producers seem to be well sold up and the consumption is increasing indications pointing to still higher prices. Spelter has advanced 1c and quotations are entirely nominal at 16c per pound.

**Lead.**—The market is quiet but firm and prices are unchanged. An advance is not at all improbable. Lead is quoted at 5¾c per pound.

**Antimony.**—The situation is becoming more serious owing to the scarcity of this metal. Supplies are being used almost entirely for munitions. Quotations have advanced 5c and are nominal at 40c per pound.

**Aluminum.**—The market is steady and quotations are unchanged at 23½c per pound.

## OUR MARITIME COAL TRADE.

OPTIMISM prevails in the coal trade of Pictou County, and the consensus of opinion among the coal mining men is to the effect that the next four months will see renewed activities in the local coal areas.

The output of the Acadia Coal Co. during the month of April was 22,901 tons, while the sales were 21,107 tons.

The output of the Intercolonial Coal Co. for the same period was 13,207, and while the outputs of both companies are not up to the average, they claim that the coal trade is due for improvement.

The Nova Scotia Steel & Coal Co. will commence shipments to the St. Lawrence at once. Vessels hired are, of course, much smaller than those usually on that route, the half dozen steamers now acting as barriers being small in comparison with those of late years. The six of them will not be able to carry more coal than two of the larger class. The Nova Scotia as well as the Dominion Coal will be hampered as to tonnage for some little time. The Nova Scotia shipments for March were 24,691 tons, as compared with 15,651 for March, 1914, the increase being 9,040. For the three months ending March, the aggregate shipments are 76,182, as compared with 86,391 for the three months of 1914, the decrease being 10,209 tons.

## MARCH FIRE RECORD.

THE Canadian fire record for March of this year is not one to be proud of. The year started well, and hopes were entertained that we were going to make a considerable reduction in the fire waste. Compared with February the number of fires is as follows:

| | Feb. | March |
|---|---|---|
| Fires over $1,000 ..... | 24 | 20 |
| Fires $1,000 and under $10,000 . . . ..... | 79 | 106 |
| Fires $100 and under $1,000 | 187 | 198 |
| Fires under $100 ..... | 291 | 364 |
| | 581 | 688 |

It will be noted that the greatest increase occurred in the smaller losses. The conclusion to be drawn from this is that a large proportion of them were preventable, and were discovered and put out when still in their incipient stages. It is also a regrettable fact that during the month of March twenty-six persons lost their lives through fires.

# Canadian Commercial Intelligence Service

**The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.**

# INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

## Engineering

**St. Catharines, Ont.**—Slough & Bush will equip a plant for making shells.

**Preston, Ont.**—The Dominion Bronze Co. will equip a plant for making shells.

**Lindsay, Ont.**—The Wilford Machine Co. have secured a contract for shrapnel shells.

**Maisonneuve, Que.** — The Shawinigan Water & Power Co. will build a repair shop here.

**Brantford, Ont.**—The Ker & Gordon Co. has been reorganized and will equip a plant for making shells.

**Moncton, N.B.**—The Record Foundry Co. will make considerable extensions to their plant for making shells.

**Truro, N.S.**—A H. McLean, of this town, is engaged in organizing a company to manufacture a tree-sawing machine.

**Orillia, Ont.**—The Canadian Smelting & Refining Co. propose to instal a nickel refining plant here and build a smelting plant at North Bay.

**Chatham, Ont.**—President L. A. Cornelius announces that the plant of the Canadian Wolverine Brass Co., destroyed by fire on April 10, will be rebuilt.

**Winnipeg, Man.**—The Ford Motor Co. of Ford, Ont., has purchased a site here and will erect an assembling plant and service station to cost $250,000.

**Paris, Ont.**—The ground floor of the town hall has been leased by the Council to G. W. McFarlane for the manufacture of shells for the Imperial Government.

**Weyburn, Sask.**—The town council contemplate buying a booster pump for the fire department, to cost $4,600. The installation of a fire alarm system is also under consideration.

**Sackville, N.S.**—The Fawcett Manufacturing Co. has secured a large contract for high explosive lyddite shells, and will begin manufacture in about a month. The shells are for the British Government.

**Peterborough, Ont.** — Wm. Kennedy, Jun., consulting engineer, Montreal, has been retained by the city to prepare plans for an auxiliary pumping plant, with a capacity of 4,000,000 gallons per day.

**Kingston, Ont.**—It is announced that the Canadian Locomotive Co. of this city has received a large order from the British Government for the manufacture of a large type of shell.

**New Glasgow, N.S.**—It is officially announced that the Nova Scotia Steel Co. has received new shell orders aggregating in value $3,600,000, while the company's subsidiary, the Eastern Car Co., has finally closed the order for 2,000 steel frame box cars, which has been under negotiation for some time.

## General Industrial

**Galt, Ont.**—P. Fitch and J. McCormack, of this town, propose to establish a silk factory here.

**Vancouver, B.C.**—The Barnett & McQueen Co. will begin shortly the construction of the new Government elevator.

**Lethbridge, Alta.**—The Taylor elevator at Vulcan has been purchased by A. Lee, who proposes to erect another with a capacity of 30,000 bushels.

**Chatham, Ont.**—It is announced that the Dominion Canners, Ltd., will build a factory here. It is expected that the factory will be erected this year.

**Sault Ste. Marie, Ont.**—The Standard Chemical Co. has commenced the erection of a large extension to its plant here and about $100,000 will be spent on the work.

**The B. F. Sturtevant Co. of Canada,** Montreal, has received the contract from the Sherbrooke Protestant School Board for the installation of a ventilating system at the high school.

**Preston, Ont.**—The industrial by-law voted on May 3rd to grant aid amounting to $21,500 to a company which will occupy the Anchor Bedding factory, was carried by a narrow majority.

**Vancouver, B.C.**—The Gosse-Millard Packing Co. has completed the purchase of the salmon cannery at Bella Bella, about 300 miles from this city, on the western coast of the mainland.

**Walkerton, Ont.**—W. G. Searle, formerly of the firm of Pletsch & Searle, proprietors of the Walkerton Flour Mills, has taken over the business of the Peerless Milling Co., on Dufferin street, Toronto.

## Municipal

**Tilbury, Ont.**—A new fire station will be erected here to cost $8,000.

**Windsor, Ont.**—The city will buy motor driven fire trucks.

**Ford, Ont.**—The town council contemplate buying a quantity of 8 in. cast iron pipe.

**Mount Dennis, Ont.**—The installation of a waterworks system is under consideration.

**Port Colborne, Ont.**—The town council may purchase 4-in. and 6-in. pipe for water mains.

**Cranbrook, B.C.**—The city is in the market for a quantity of 4-in. steel pipe and fire hydrants.

**Redcliffe, Alta.**—The fire committee has recommended the purchase of a motor fire-truck.

**Preston, Ont.**—The Board of Trade is negotiating with a company who propose to locate here.

**Blenheim, Ont.**—The Hydro proposition by-law was carried here on Monday by a majority of 236.

**Ottawa, Ont.**—The city will buy a number of water meters and has appropriated $2,500 for this purpose.

**Bracebridge, Ont.** — Extensions are contemplated to the waterworks system to cost $12,000. The by-law has been passed.

**Regina, Sask.**—The city has appropriated $121,000 for sewage disposal improvements, waterworks and power distribution extensions.

**Thamesville, Ont.**—The Hydro-Electric by-law carried here last Monday almost unanimously. The figures are 124 for the by-law and 2 against.

**Swift Current, Sask.**—A by-law will be voted on to raise $15,000 for the construction of an incinerator. The Reid Incinerator Co., of Toronto, will probably erect the plant.

**Hamilton, Ont.**—The town of Burlington has made application before the Provincial Board of Health with reference to the provision of a sewage disposal plant in the township of Nelson. The work will involve an immediate outlay of $14,000, and a total expenditure of $150,000.

**Ridgetown, Ont.**—The ratepayers carried the Hydro by-law on Monday by a vote of 254 to 38. The by-law to change the present system and instal Hydro was carried by 223 majority.

**Chesley, Ont.**—It is expected that a by-law will be submitted inside of a month to enable the town to contract for a supply of hydro power. The plan is to extend the Eugenia Falls-Owen Sound line as far as Chesley, and supply this town and intermediate points with power developed at Eugenia.

**Hamilton, Ont.**—Tenders for motors for the disposal plant at Gage Avenue have been opened. The tender of the Swedish Electric Co., which was $2,750, was the lowest, and the Canadian Westinghouse Co. tender of $3,325 the next lowest. The city engineer recommended the Westinghouse tender, as there was doubt as to delivery from Sweden.

**Stratford, Ont.**—Second reading was given by the city council on May 5 to two by-laws, one providing for a $2,500 site grant to the Bartlett Automobile Co. of Toronto for the establishment of a factory here, and the second providing $7,000 to retire the General Hospital floating debt. In the Bartlett measure a minimum wage stipulation of eighteen cents per hour was agreed to by the company, constituting a precedent for industrial by-laws here. May 31 was set as the date for voting on both by-laws.

# Tenders

**Brockville, Ont**—Tenders will be received up to May 17 for the construction of a mechanical filtration plant. Plans and specifications may be seen at the office of G. H. Bryson, Town Engineer.

**Orillia, Ont.**—Tenders will be received until May 17, for centrifugal pumps and motors, cast iron pipe and a Venturi meter. Specifications at the office of F. Gover, sec'y-treas., Water, Light and Power Commission, Orillia.

**Transcona, Man.**—Tenders will be received up to May 15 for the supply and erection of pumps and motors, etc. Plans and specifications may be obtained from W. M. Scott, engineer, 204 Sterling Bank Building, Winnipeg, Man.

**Ottawa, Ont.**—Tenders will be received until Thursday, May 20, 1915, for dredging required at Toronto, Eastern Gap. Combined specifications and form of tender can be obtained on application to the Secretary, Department of Public Works, Ottawa.

**Toronto, Ont.**—New tenders will be received until Friday, May 14, 1915, for Administration Building, College Street. Specifications may be seen and all information obtained at the office of the Superintendent of Buildings, City Hall, Toronto.

# Contracts Awarded

**Brantford, Ont.**—Schultz Bros. Co. have been awarded the contract for the new power station.

**The Kerr Engine Co.**, Walkerville, Ont., has been awarded a contract for hydrants by the town of Parry Sound, Ont.

**Hamilton, Ont.**—The Board of Control has awarded the general contract for the new hospital to James Frid & Co., at $90,529.

**ALLIES PURCHASING AGENTS.**

**The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:—**

**British.—Lieut. Johnston and A. C. Billing, Ritz Carlton Hotel, Montreal.**

**French—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendance Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.**

**Russian — Messrs. S. Ruperti and Aiekieff, care Military Attache, Russian Embassy, Washington, D.C.**

**London, Ont.**—The contract for the new grand stand at Queen's Park has been awarded to the McGregor, McIntyre Co., of Toronto, for $29,500.

**Ottawa, Ont.**—Thomas Lawson & Sons received the contract for pipe for the four low-lift pumps at Lemieux Island at $1,777.

**Wallaceburg, Ont.**—At a special meeting of the Board of School Trustees, the contract was awarded to W. G. Shaw of Sarnia for the erection of the new school, at the bulk price of $20,885.

# Building Notes

**Calgary, Alta.**—Plans are being prepared for an addition to the Collegiate Institute to cost $200,000. The Building Commissioner has the matter in hand.

# Refrigeration

**Calgary, Alta.**—A company is now being organized to operate a large abattoir and packing plant here. The plant itself is estimated to cost $600,000.

**Montreal, Que.**—The Standard Chemical Co. has had installed by the Linde-Canadian Refrigeration Co. a 25-ton refrigerating and water cooling plant.

**Estevan, Sask.**—Alfred Harris, of the Clarendon Hotel, is organizing a company to establish a pork packing plant here. The cost is estimated at $17,000.

**Toronto, Ont.**—John Klees has had his storage rooms equipped with a 5-ton refrigerating plant furnished by the Linde-Canadian Refrigeration Co., Montreal.

**Morrisburg, Ont.** — The Morrisburg Poultry Co. have had their poultry, butter and egg storage rooms equipped with a 25-ton refrigerating plant by the Linde-Canadian Refrigeration Co., Montreal, P.Q.

**Montreal, Que.**—William Davies, Ltd., packers, have had a complete 50-ton air cooler installed, contract for which including pumps, fans, spray system, air ducts, etc., was let to the Linde-Canadian Refrigeration Co.

**Windsor, Ont.**—William J. Pulling, of this town, has purchased the artificial ice manufacturing plant of the Central Ice Co., of this city. The price paid is stated as $43,000 in cash. The plant, which was built only last year, cost in the neighborhood of $85,000.

# Marine

**Port Stanley, Ont.**—The steamer J. Frater Taylor is now awaiting survey in the Western Dry Dock.

**Toronto, Ont.**—It is announced that the Toronto Harbor Commission will spend $2,000,000 this season on improvements. A large part of this money will be spent on the Ashbridge's Bay section.

**Sault Ste. Marie, Ont.**—Because of low water on the Great Lakes many vessels are forced to sail with 400 and 500 tons less than they would ordinarily carry if the water were normal. The recommended draught at the "Soo" for boats loading for Lake Michigan has been cut down six inches. All masters of the Pittsburg fleet have been notified not to load deeper than 19 feet 3 in. when taking cargoes from the head of the lakes for Lake Michigan. Many carriers trading to Lake Erie ports are now loading to 18 feet 9 in. only.

# New Incorporations

**Canada Ingot Iron Co.** has been incorporated at Ottawa with a capital of $20,000 to manufacture steel culverts, pipe, sheets, etc., at Guelph, Ont. Incorporators: Henry B. Sharman, Robert William Gladstone, of Guelph.

**The Standard Primer & Fuse Co.** has been incorporated at Ottawa with a capital of $150,000 to manufacture time and percussion fuses, detonators, etc., at Toronto, Ont. Incorporators: Thomas A. Rowan, Norman Somerville and Harry A. Newman, all of Toronto.

# Wood-Working

**Niagara Falls, Ont.**—Fire did $25,000 damage to the Richard Smith and Sons' lumber mill here on May 9.

**Pembroke, Ont.**—Fire on May 4 damaged the Pembroke Lumber Co.'s sash and door factory to the extent of $75,000, which is fairly well covered by insurance.

# Railways—Bridges

**Walkerton, Ont.**—A new bridge will be erected here at a cost of about $2,000.

**Palmerston, Ont.**—A hydro-electric line is proposed to connect Milverton, Listowel, Palmerston, Harriston and Clifford.

**Brantford, Ont.**—The Lake Erie & Northern Railway propose to connect with the Galt, Preston & Hespeler line at Galt, and electrify the road through to Port Dover.

**Brantford, Ont.**—Work on the Lake Erie & Northern Railway south of Brantford, on the line to Port Dover, is being rushed. Track laying has started at Simcoe and Mount Pleasant.

# Personal

**Lieut. H. F. H. Hertzberg** of the 2nd company of Canadian Engineers, has been wounded in Northern France.

**Dr. F. S. Pearson,** a well-known figure in Canadian financial circles, was drowned by the sinking of the Lusitania.

**James Barr, B.Sc.,** assistant engineer of the Waterworks Department, Toronto, lost his life when the R.M.S. Lusitania foundered.

**Lieut. Henry Aubrey Thompson,** of Mitchell, Ont., and engineer in the Department of Public Works, Chase, B.C., has been wounded at the front.

**T. J. Scott,** Canadian Locks, Sault Ste. Marie, Ont., is now equipped to undertake repairs necessitating the application of the electric welding process.

**F. L. Wanklyn,** assistant to the president, C. P. R., at Montreal, has been appointed honorary lieutenant-colonel of the Canadian Overseas Railway Construction Corps.

**George E. Francklyn,** agent for Lloyd's underwriters, died at Halifax, N.S., on May 2. Mr. Francklyn, who was 67 years old, was a grandson of Samuel Cunard, founder of the Cunard Line.

**J. A. Farrel,** president of the United States Steel Corporation, was in Winnipeg, Man., recently. He is on a pleasure tour of Western Canada, prior to visiting the Panama-Pacific Exposition at San Francisco.

**John Goodison,** president of the John Goodison Thresher Works, died on May 7 at Sarnia, Ont. Mr. Goodison was born in Ireland in 1850 and came to Canada 8 years later. He founded the company bearing his name in 1892.

**M. J. Gorman,** mechanical superintendent of the National Steel Car Co., Hamilton, Ont., who is leaving the company, was on May 1 presented with a diamond ring by the foremen and assistants as a token of esteem. The presentation was made by Cecil R. Keniston.

**John Morris,** chief engineer of the Newmarket waterworks and electric light system, has resigned his position and leaves for a northern town. He will be succeeded by William O'Halloran, who for more than 12 years occupied the position previous to Mr. Morris.

**J. G. G. Kerry,** of the firm of Smith, Kerry & Chase, Toronto, was in Hamilton recently for the purpose of examining the new east end main and pumping station. Mr. Kerry will also report on the advisability of the city building a large reservoir and also on a system to keep down heavy Hydro bills.

**J. K. McNeillie,** C.P.R. superintendent of district No. 3, has been appointed general superintendent of the Intercolonial Railway, and has left Montreal to assume his new duties at Moncton, N.B. Mr. McNeillie joined the C. P. R. in 1896 as a clerk at Farnham, and has been in important positions on the C. P. R. at Winnipeg, Toronto and Montreal.

**F. P. Brady,** who has been general superintendent of the I. C. R. at Moncton for the past eight or ten years, has been appointed general manager of the National Transcontinental Railway, between Quebec and Winnipeg, and the Lake Superior branch of the Grand Trunk Pacific Railway between Fort William and Superior Junction, with headquarters at Cochrane, Ont.

# Trade Gossip

**The Gartshore-Thompson Pipe & Foundry Co.** have received the contract for 1,400 feet of cast iron pipe from the city of Hamilton, Ont.

**C. M. A. Annual Convention.**—The Annual Convention of the Canadian Manufacturers' Association will be held in Toronto, from Tuesday, June 8, until Thursday, June 10, inclusive.

**St. Thomas, Ont.**—The Noble Manufacturing Co. biscuit and candy factory, which has practically been closed for the past few months, is reopening at once, with S. Herbert Moore, late of Toronto, as general manager. The company has been completely reorganized, with George M. Baldwin, president, and J. Dowler, vice-president.

**Russian Shell Commission.**—Several members of the Shell Commission, appointed by the Russian Government to visit this country and the United States, and especially the centres where the heavy orders are being filled, have arrived in Canada. A general of the Russian Army is chairman of the commission, and that officer will reach here a little later on. The party is composed of Capt. W. Wexkrassoff, Capt. Oranowsky, Capt. Grodski, and Messrs. Adrinoff and Sokoloff.

**The Lauzon Engineering Co., Ltd.,** Levis, P.Q., have bought the large factory building, together with the machinery therein, formerly occupied by the General and Shoe Machinery Co. of Levis. The building and equipment have been thoroughly overhauled and about $50,000 worth of new machinery installed. It is intended to go into the manufacture of shrapnel shells in a large way. In addition to the manufacture of shells, the above company intend doing marine and general mechanical work. Harry Paquette will be the general manager, and J. H. Fontaine, mechanical superintendent.

**Canadian Locomotive Co. Extensions.**—In view of the additional shell orders that have been secured by the Canadian Locomotive Company, Kingston, Ontario, according to a statement by A. W. Wheatley, vice-president and general manager, it has been found necessary to proceed with additions to the plant. The new extensions will be utilized for the manufacture of 4.5 and 60-pounder shells. The new shop, which is to be 233 feet long by 67 feet wide, will, it is expected, be ready for occupation within six weeks. The com-

IF IT'S MACHINERY—
WRITE "WILLIAMS"

pany has 400 employees at present on its books, and, with new orders pending, this number should be almost doubled.

**High-speed Steel Boom.**—There is no abatement in the demand for high-speed steel. Every available furnace in Great Britain for which men can be found, is working on this material, and any maker, however little known, can pick up more orders than he wants. The occupation of the traveller has gone for the present, as there is no need to solicit business. On the contrary, consumers of steel are begging to be supplied. The demand for alloys of steel far and away exceeds anything previously known, and the utmost difficulty is experienced in meeting it, especially when the material has to be imported. English makers are working day and night. Steel makers are still awaiting the tungsten powder to be produced in this country.

**Scarcity of Tonnage.**—The opening of St. Lawrence navigation brings no promise of relief in regard to the scarcity of ocean tonnage. All the larger and faster ships formerly in the Canadian service are still in use by the Admiralty and there is no prospect of their being released, especially in view of the recent increase in the sphere of British military operations. The presence of large armies in Europe, in Egypt and in the Gallipoli Peninsula, calls for a large fleet of transport and supply ships, and there is no expectation that any of these ships will be released by the Admiralty during the present season. At the same time it is expected that a reasonably good mail service will be maintained, perhaps as good as the old service, though not equal to the improved fast and frequent service which was in operation prior to the outbreak of war.

## Catalogues

**Oil Strainers.**—A new bulletin published by the Elliott Co., Pittsburg, Pa., is devoted to a description of their twin oil strainers. Several views are shown of this apparatus with a table of dimensions.

**A Manufacturing Power Press** is the title of a bulletin issued by the Rockford Iron Works, Rockford, Ill. The bulletin illustrates various types of Rockford high-duty punch presses and gives a specification comprising the principal dimensions for each size.

**Test Indicators.**—The C. E. Robinson Co., Orange, Mass., has issued a bulletin describing their improved test indicator designed to record the minutest variations possible and at the same time to be capable of limitless adjustments to any class of mechanical work. The indicator and attachments are fully described and a series of illustrations show some classes of work for which it is specially suitable.

**A Safety Code** for the use and care of abrasive wheels has been compiled by the Safety Committee of the abrasive wheel manufacturers of Canada and the United States. The code is to be used as the foundation of a campaign for uniform laws and insurance rules in an endeavor to overcome present and prevent future unsafe practices. The whole subject of grinding has been carefully covered and many valuable suggestions are included. Copies of the code may be obtained from the Canadian Hart Wheels, Ltd., Hamilton, Ont.

**Cableways on Filtration Work** are clearly described in bulletin No. 32 being distributed by Canadian Allis-Chalmers, Ltd., Toronto, exclusive agents for Canada for the Lidgerwood Manufacturing Co., New York. The bulletin contains some interesting particulars of installations of Lidgerwood travelling cableways used in the construction of water filtration plants. Views of the work are included, showing the advantages to be obtained by using cableways and the general utility of this system of transporting materials.

**Bruce Peebles & Co.**, Edinburgh, Scotland, have recently published a new booklet No. 706B, entitled Peebles' Works and Manufactures. The booklet is divided into two distinct parts, the first giving a detailed description of the company's works and development of the business from the time of its inception. The illustrations show interior views of the various shops referred to in the text. The second part consists of a number of half-tones of different types of electrical machinery made at the company's works, accompanied by a brief description of each machine.

**Grinding Wheels.**—The Canadian Hart Wheels, Ltd., Hamilton, Ont., have issued a standard grinding wheel price list which will be effective on July 1, 1915. This new list does not attempt to fix new prices, but simply introduces a method of ascertaining consistent list prices. When the present list is withdrawn, new discounts will be issued, where necessary, to apply to the new list adopted by the leading manufacturers of grinding wheels in Canada and the United States. The new lists have been adopted in order to correct the inconsistencies in the present standard lists in relation to the value of different size wheels to each, and in their relation to the cost of manufacture. Users of grinding wheels may obtain copies on application to the above.

**Testing V-Notch Meters**, issued by the Harrison Safety Boiler Works, Philadelphia, Pa., is a reprint of two important papers on the V-notch weir as used in the Cochrane Metering Heaters. The earlier paper, by James Barr, describes at considerable length and detail the apparatus used by him, and the results obtained in tests conducted at Glasgow University in 1907-09, by which he established the fact that with a V-notch weir, the true discharge for given conditions could be determined within 1-3 of 1 per cent. The latter paper, by W. S. Giele, describes a commercial testing apparatus of large capacity installed by the Harrison Safety Boiler Works for the purpose of carrying out an extensive series of tests upon V-notch weirs of different dimensions and as actually installed in commercial meter chambers manufactured by them. Both papers are interesting as illustrating on the one hand the many refinements which are essential in the precise investigation of problems in hydraulics, and, on the other, the admirable constancy of the V-notch weir when used under known and pre-determined conditions.

## Book Reviews

**Boiler Management and Inspection,** published by the Joseph G. Branch Publishing Co., Chicago, Ill., is listed at $1 post paid, and not 50c as stated in the review published recently in Canadian Machinery.

**Effect of Boron Upon the Magnetic and Other Properties of Electrolytic Iron Melted in Vacuo,** by Trygve D. Yensen, has just been issued as Bulletin No. 77 of the Engineering Experimental Station of the University of Illinois. This bulletin is the second of a series dealing with the magnetic, electrical, mechanical, chemical, and metallurgical properties of iron melted in a vacuum furnace. It was shown in Bulletin No. 72, "Magnetic and Other Properties of Electrolytic Iron Melted in Vacuo," that iron of an exceptionally good magnetic quality could be produced in such a furnace. Bulletin No. 77 gives the results obtained by adding boron to pure iron. Small percentages of boron added are shown to improve the iron slightly, while boron added in a sufficient amount to leave a measurable quantity combined with the iron has a decidedly detrimental effect upon the magnetic properties. The crystalline structure of the alloys is shown by means of numerous photographs. Copies of Bulletin No. 77 may be obtained gratis upon application to C. R. Richards, Acting Director, Engineering Experiment Station, University of Illinois, Urbana, Illinois.

## ANTI-AIR CRAFT GUNS.

DURING recent years, much time and money has been expended on the perfection of guns giving high-angle fire for the destruction of aircraft. A great measure of success has already been attained in the solution of this problem, which literally bristles with difficulties, first among which is that of hitting any rapidly moving and inconspicuous object at great ranges. In the case of aircraft, difficulties are further increased by the fact that there are no landmarks in the zone of fire, to facilitate range finding. Events in the present war indicate that aeroplanes are best attacked by other and faster planes, and there can be no doubt that aeroplanes would be very valuable in attacking airships. At the same time, the size of the latter marks them down as objects on which artillery fire could usefully be directed.

The exact value of the anti-aircraft gun has yet to be demonstrated, or perhaps we should say published. Its object is definite, viz., to wreck aeroplanes or airships. Mere explosion of shrapnel in the neighborhood of an aeroplane is not sufficient to ensure its destruction; modern machines have remarkable stability, and nothing much less than mortal injury to the engine or pilot is effective. Rifle fire from another aeroplane seems to afford quickest and most effective defence. The vital part of an airship is its gas envelope. It is the largest target, and if it be damaged badly the fate of the craft is sealed. Cellular construction renders local damage or mere penetration of minor importance.

What is required is explosion of an incendiary shell on or within the envelope with consequent ignition of the gas. Flat trajectory increases the chance of a hit even when the range is inaccurately estimated, and a smoke trail permits the path of the shell to be traced and the fire to be regulated in accordance therewith. Specially delicate percussion, trigger, chemical and electric fuses have been devised in order that the slight resistance offered by the envelope may suffice to explode the shell. Trials have been made with special claws on the projectile, the aim being to rend the envelope, but wholesale explosion would seem more practicable and certainly more effective.

Most of the great arsenals have turned out 6, 9, 12 or 14 pounder anti-aircraft guns for field use, and heavier weapons up to 40-pounders for stationary mounting. Elevation up to 75 degrees in any direction is arranged, and a maximum height of 20,000 feet or so is reached by the shell. Obviously no ordinary field gun is capable of meeting these requirements, and howitzers give insufficient accuracy of fire. Only a high velocity, high angle gun can be effective.

The man in the street is considerably concerned to know what happens to the shells after they have hit or missed the hostile aircraft. Naturally they come down again, and when a crowded city is being defended inhabitants would be well advised to obey the official advice to keep indoors. From the military standpoint, however, the falling shells are of no importance. The object is to bring down some hundredweights or some tons of aircraft presumably much nearer the defender's forces than the relatively insignificant shells will fall.

## POWDER AND SHOT.

IN the British House of Commons recently, Mr. Lloyd George announced that at the present time, by methods of sub-contracts, between 2,500 and 3,000 firms were employed in the manufacture of munitions of war; and gave an interesting indication as to how the output has proceeded. In September there was a considerable increase over August, and there was an increase in August over July, but he took September as his basis.

Taking 20 as representing the output in September, by October it went up to 90, and in November it was 90 again. Of course the new machinery laid down did not come into operation until a month later. In December it was up to 156, January 186, February 256, and March 388.

This means that even the increased output in September was in March multiplied nineteen-fold, and the Chancellor had no hesitation in saying that in April the increase would correspond to that which had taken place in the previous months. Nor is this the whole of the Allies' advantage, for, according to Bonar Law's information, while we have multiplied our munition output by 19, France has increased hers by 30 fold.

## Genuine Armstrong Stocks and Dies

**Hinged Pipe Vises.**

**Pipe Cutters. Steam and Gas Fitters' Tools.**

**Pipe Machines for Threading Pipe.**

**Either Hand or Power.**

*Manufactured by*

**THE ARMSTRONG M'F'G CO.**

**328 KNOWLTON ST. BRIDGEPORT, CONN.**

**NEW YORK, 248 CANAL ST.**

## Light and Heavy Riveting

can be done equally well on our ELASTIC ROTARY BLOW RIVETING MACHINE because the force of the blow is always under the control of the operator, and quickly adjusted to suit the work.

The machine is made in several sizes and styles, and every head is perfectly formed, any shape you wish.

**Catalogue?**

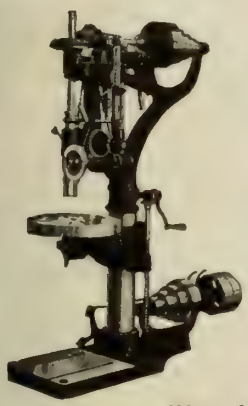
**The F. B. SHUSTER COMPANY**

**New Haven, Conn.**

Formerly John Adt & Son. Established 1866

Also makers of Wire Straighteners, for rounds, squares, hexagons, etc.

Canadian Agents: A. R. Williams Machinery Co., Toronto.



## Our 23" Mechanic's Drill

has features with which you may not be familiar.

There are eight speeds provided, with quick advance and return.

Stationary Head and Back geared with automatic stop. This drill can be motor-driven and will drive high-speed drills to their utmost capacity. The quality is the same as all "Rockford" quality—the best.

**Write for descriptive catalogue.**

**Rockford Machine Tool Co.**

**Rockford Illinois**

**Mfrs. of the Rockford Planer and Shaper.**

## J.C.McLAREN BELTING

**Will Save You Money In Every Day of Service**

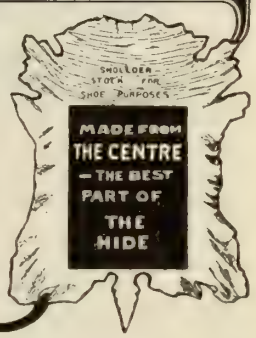
Modern plant and thorough knowledge of requirements of belting guarantees perfect satisfaction to all buyers. Our belts are the result of using best leather, and our 57 year's experience.

**Ask for Quotations.**

**J. C. McLAREN BELTING CO.**

**Limited**

**Montreal Toronto Winnipeg**



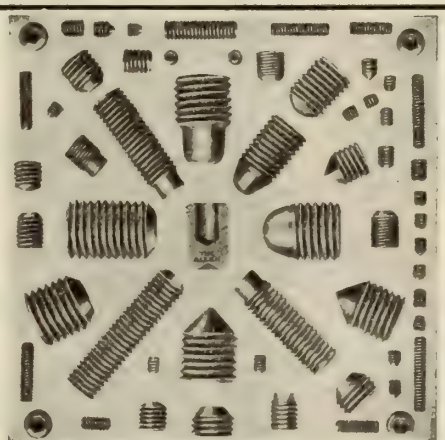
## The Garvin Machine Co.

**Manufacturers of**

Milling Machines; Profiling Machines; Cam Cutting Machines; Screw Machines; Monitor Lathes; Die Slotting Machines; Screw Slotters; Tapping Machines; Duplex Horizontal Drills; Gang Drill Presses; Four-Head Right-Angle Drills; Wrenchless Chucks; Spring Coilers; Cutter Grinding Machines; Surface Grinders; Hole Grinders; Hand Lathes and Special Machinery.

**We Want All To Have Our Catalog—Send For It To-day.**

**Spring and Varick Streets, NEW YORK CITY**



ALLEN Safety Set Screws, any length, point or thread.

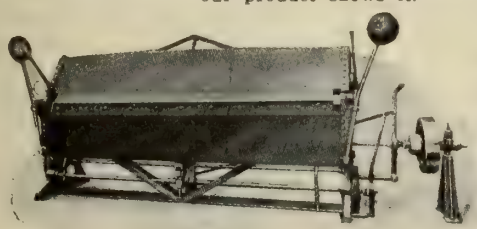
**Send for circular No. 3 and free sample screws.**

**THE ALLEN MFG. CO., Inc., St. Johns, P.Q., Canada**

**England: 173 Princess St., Manchester.**

## Chicago Steel Bending Brakes

We are exclusive Manufacturers of Steel Bending Brakes, and our product shows it.



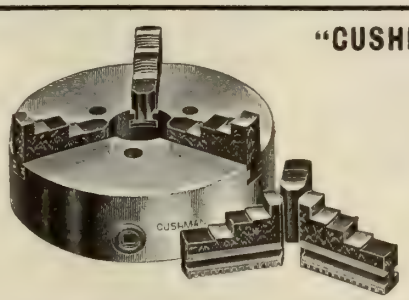
Only about three horse-power is required to operate this brake full capacity.

**Catalog giving full description mailed upon request.**

10 ft. for 10 Ga.

**The Steel Bending Brake Works, Ltd., Chatham, Ontario**

## "CUSHMAN" CHUCKS



are generally known as the "heavy pattern," being designed for hard service.

Their accuracy and reliability have been proven over and over again, and the name "Cushman" on your chuck is a guarantee of satisfaction.

Our line consists of many styles and sizes of Lathe Chucks. Drill Chucks, Centering Chucks, and Face-Plate Jaws.

**Catalogue Free.**

**THE CUSHMAN CHUCK CO.**

**Hartford, Established 1862 Conn., U.S.A.**

Tumblers—Large Line.
Burnishing Machines. Grinders.
Special Machines.

**Baird Machine Co., Bridgeport, Conn.**

**20 TIMES THE SERVICE**

That's what this self-hardening, high-speed steel chaser does for the LANDIS DIE.

Four long cutters tangentially disposed to the work carried in suitable holders make an ideal cutting condition. This, along with its many other distinctive characteristics, has established for us a world-wide reputation.

WRITE FOR CATALOGUE NO. 21.

## NORTON JACKS

**For all kinds of heavy lifting**

Send for complete catalogue showing 50 styles 10 to 100 tons capacity.

Made only by

**A. O. NORTON, LIMITED**
Coaticook, Prov. Quebec - - Canada

## Gives Satisfaction Where Other Metals Fail

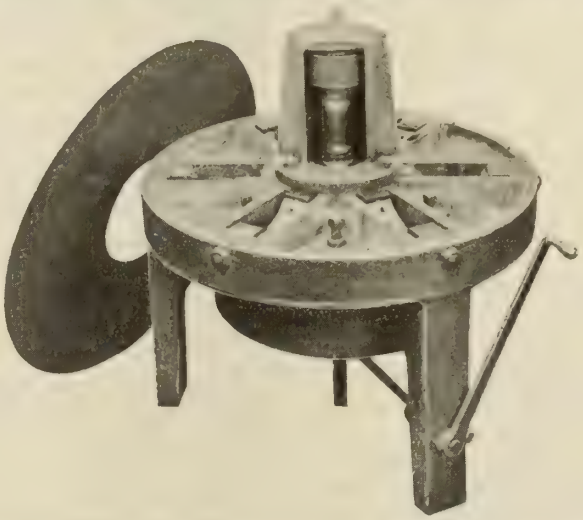
Sold by Leading Dealers Everywhere, or by

**MAGNOLIA METAL CO.**

Office and Factory:
225 St. Ambroise St., Montreal

TRADE MARK

# Shell Banding, Nosing and Painting Machines



For nosing, pressing bands on shrapnel and high explosive shells; also painting shells.

These machines are operated by air, are easily controlled, utilize a small amount of space and have a large output.

Banding press is sold without nosing attachment if desired.

Painting machine is operated with an ordinary air drill, and if desired, a heating coil under table, enclosed in a sheet steel shell, can be supplied, as shown in cut.

*If you are interested, write us for particulars.*

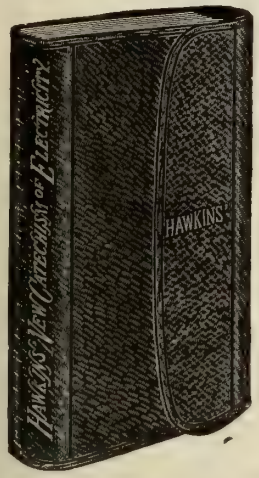
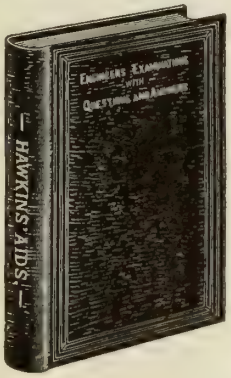
# Books for the Engineer's Library



## *Hawkins' New Catechism of Electricity*

It contains 550 pages with 300 illustrations of electrical appliances; it is bound in heavy red leather, with full gold edges and is a most attractive handbook for electricians and engineers. One third of the book is devoted to the explanation and illustrations of the dynamo, with particular directions relating to its care and management.—$2.00



## *Engineers' Examinations*

*By N. Hawkins, M.E.*

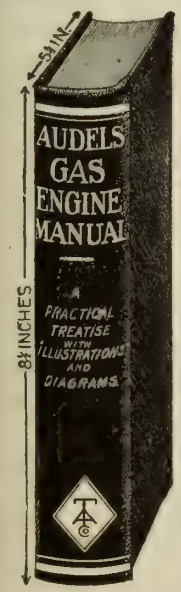
It presents in a condensed form the most approved practice in the care and management of steam boilers, engines, pumps, electrical and refrigerating machines, with examples of how to work the problems relating to the safety valve, strength of boilers and horse power of the steam engine and steam boiler.—$2.00.

## *Steam Turbines*

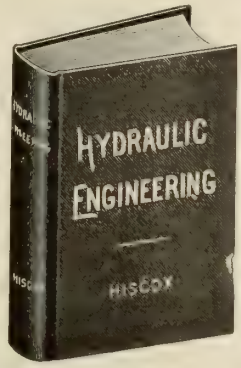
*By Leland.*

A reference work on the development, advantages and disadvantages of the steam turbine: the design, selection, operation and maintenance of steam turbine plants and turbo-generators. 135 pages. Illustrated.—$1.00.

## *Audel's Gas Engine Manual*



A practical treatise relating to the theory and management of gas, gasoline and oil engines, including chapters on producer gas plants, marine motors and automobile engines.—$2.00.



## *Hydraulic Engineering*

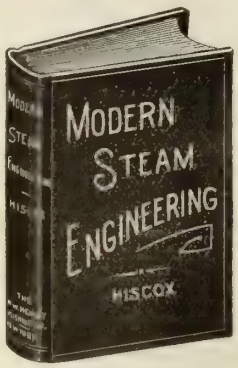
*By G. D. Hiscox.*

This comprehensive book of Hydraulics written by an experienced engineer, is a practical treatise on the properties, power and resources of water for all purposes, including the measurement of streams, the flow of water in pipes or conduits; the horse power of falling water; turbine and impact water wheels; wave motors, etc. All who are interested in Water Works Development should have a copy. 320 pages, 305 illustrations. Price, $4.00.

## *Compressed Air*

*By L. I. Wightman, E.E.*

A reference work on the production, transmission and application of compressed air; the selection, operation and maintenance of compressed air machinery; and the design of air power plants. Illustrated.—$1.00.



## *Modern Steam Engineering in Theory and Practice*

*By Hiscox.*

This book has been specially prepared for the use of the modern steam engineer, the technical students, and all who desire the latest and most reliable information on steam and steam boilers, the machinery of power, the steam turbine, electric power and lighting plants, etc. 450 pages, 400 detailed engravings.—$3.00.

## *Boiler Construction*

*By Kleinhans.*

The only book showing how locomotive boilers are built in modern shops. Shows all types of boilers used; gives details of construction; practical facts, such as line of riveting punches and dies, work done per day, allowance for bending and flanging sheets and other data that means dollars to any railroad man. 421 pages, 334 illustrations, six folding plates.—$3.00.

## *Compressed Air, Its Production, Uses and Application.* *By G. D. Hiscox, M.E.*

Comprising the physical properties of air from a vacuum to its liquid state, its thermodynamics, compression, transmission and uses as a motive power in the operation of stationary and portable machinery, in mining, air tools, air lifts, pumping of water, acids and oils and the numerous appliances in which compressed air is a most convenient and economical transmitter of power.—Price $5.00.

## *Boiler Accessories*

*By Walter S. Leland, S.B.*

Assistant Professor of Naval Architecture, Mass. Institute of Technology, American Society Naval Architects and Marine Engineers. 144 pp., 80 illus. Cloth binding. A treatise giving complete descriptions of the various accessories of the boiler room and engine room essential to economical operation, such as evaporators, pumps, feed-water heaters, injectors, mechanical stokers, etc., with practical instruction in their use.—Price $1.00.

# CENTER GRINDER

(Improved)

**CHEAP! PRACTICAL! DURABLE!**

The most popular tool of its kind on the market. Adjusted in a moment.

An occasional use will keep your Lathe centers in perfect order.

## Stow Mfg. Co.

**Binghamton, N.Y., U.S.A.**

Chicago Office, 106 So. Jefferson St.

## The Measure of a Drill

Pick out a drill—its looks, its price, count for little. The measure of a drill is—How many holes will it make?

### Cleveland Twist Drills

measure up because of their well known hole-producing qualities.

*Are you getting "Drill Chips" each Month? If not, ask for it.*

**The Cleveland Twist Drill Co.**

New York Cleveland Chicago

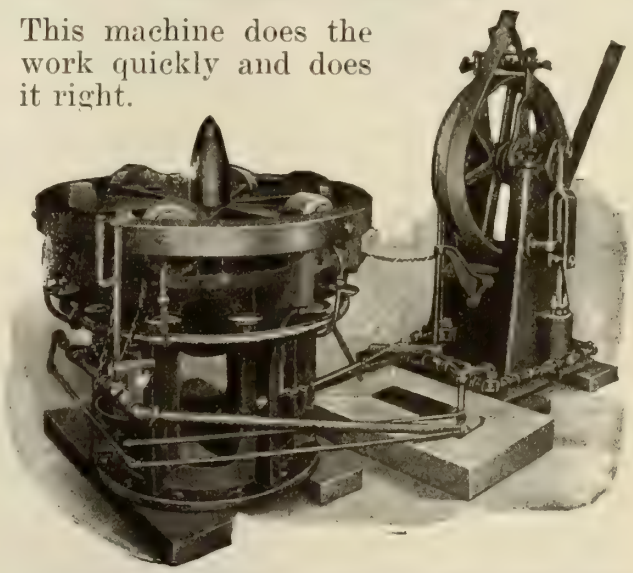
PIPE VENTILATED A C MOTOR

FOR VERY DIRTY PLACES

## Hydraulic Banding Machine

**For compressing bands on shrapnel shells and other projectiles**

This machine does the work quickly and does it right.



**In writing for information or quotation please advise width** and thickness of bands and diameter of shells to be handled.

Machines for our Canadian Customers are built in Hamilton, Ont.

We also manufacture machines for setting wagon and carriage tires, cold.

**Please address all communications to our Rochester Office.**

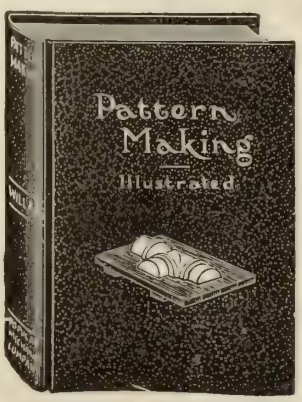
By G. H. WILLARD

**Two Significant Opinions:**

"I think the book is the best I ever saw for the price." Edwin Sluyter, Construction Engineer, Burroughs Adding Machine Co., Detroit.

"I consider this is a valuable book and should be in the hands of all men engaged in this line of business." E. W. Clarke, Wilmington Malleable Iron Co., Wilmington, Delaware.

224 Pages. 312 Illustrations. Cloth Cover.



**With Additional Chapters on Core-Making and Molding**

**"WRITTEN SO YOU CAN UNDERSTAND IT."**

A book for the man who does the work. Written by a practical patternmaker of many years' experience. Gets right down to business in the first chapter and keeps it up throughout the book. Full of kinks and actual working information. Profusely illustrated.

**Chapter Headings**

I. Pattern-Making as a Trade. II. The Tools. III. Woods. IV. Joints. V. Turning. VI. Turning (Continued). VII. Turning (Continued). VIII. Turning (Concluded). IX. The Circular Saw. X. The Circular Saw (Continued). XI. Machine Tools. XII. Machine Tools (Continued). XIII. Simple Patterns. XIV. Simple Patterns (Continued). XV. Simple Patterns (Concluded). XVI. Crooked Patterns. XVII. Large Pattern Work. XVIII. Large Pattern Work (Continued). XIX. Crosshead Guide Patterns. XX. Sweep Work. XXI. Pipe Work. XXII. Stove Pattern Work. XXIII. Molding—Machine Work. XXIV. Molding—Pattern Work.

**Part II.—Core-Making and Molding.**

Chapter I. Core-Making. Simple and Complex. II. Principles in Molding. III. Loam Patterns and Loam Molds. Everyone following this trade, or intending to learn it, should have a copy of this valuable book.

**Price $1.10 Postpaid.**

**Make One Barrel Do What Two Barrels Did Before**

THE minute you install one Globe Tumbling Barrel you can pension two of your old-fashioned horizontal barrels and still do a wider variety of work —and do it a great deal better and many times faster.

**GLOBE TUMBLING BARRELS**

save time because they don't have to be stopped for filling, emptying or inspecting of the work. They save floor space, because they stand vertically and occupy little room—and they save money, because they require a smaller investment in barrels.

**Eight stock sizes, $50 to $170. Our Booklet 2 contains useful information on tumbling — shows the different styles of Globe Barrels and tells what each will do. Write for a free copy to-day.**

**The Globe Machine & Stamping Co.**
**Cleveland, Ohio, U. S. A.**

# No, Stevens' Stopper won't stop a train, but it will stop the blow hole in a defective casting so that you cannot find it.

In this way, it helps your bank account. The casting that otherwise would have to go to the scrap heap can be converted into good coin of the realm.

Same color as the rest of the casting. Doesn't look like a blue patch on Casey's faded overalls.

*How to use Stevens' Stopper, or Circle Cement:*

Stevens' Stopper is a fine powder, used with a little water and made into a paste—the hole is easily filled with a putty knife or trowel. It takes anywhere from two to twenty-four hours, depending upon the size of the patch, for the filler to become as hard as the casting itself. When rubbed with a file it shows the color of the casting, hence it is the best filler and the one thing that saves your castings, and that means the saving of your dollars.

Another thing—I do not ask a fancy price for it.

A pound will save many dollars' worth of castings. Put up in 5-lb., 10-lb., and 25-lb. cans.

# ELECTRIC STEEL CASTINGS

E S & M

BRAND

**Stands for Quality.**

High-Grade Steel Castings of every description.
Clean, Sound, and true to pattern.
From 1 lb. and upwards.

Manganese and all Alloy Steel Castings, Mining Bar and Rock Drill Steel, Forging Ingots.

**WRITE FOR PRICES AND PARTICULARS.**

**THE ELECTRIC STEEL & METALS COMPANY, LTD.**

**Welland - Ontario**

# STEEL CASTINGS

WE MANUFACTURE

**Adamantine, Chrome, Manganese and Nickel Steel Castings**

ANNEALED AND UNANNEALED

**NONE TOO LARGE FOR US TO HANDLE.**

## MACHINE MOULDED GEARS

Any size up to 18 feet in diameter,
**without the use of patterns.**

## Hull Iron & Steel Foundries

**LIMITED**

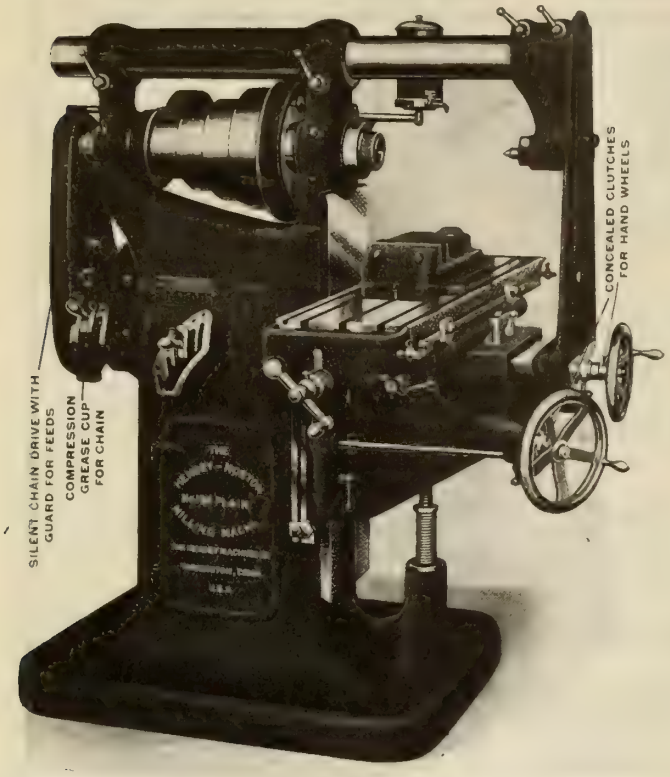
**Head Office and Works at HULL, P. Que.**

**Branch Office at Montreal, P. Que.**

TRADE MARK

*If what you want is not advertised in this issue consult the Buyers' Directory at the back.*

# Hendey Millers will take any kind of a miller job



## *that comes in to the modern shop*

**and it delivers the finished work in the highest degree of accuracy and perfection.** It has a wide range of spindle speeds (16) and feeds (18).

The **"Hendey"** is free from the usual complicated features. All working positions are secured with but **few and easily understood movements** on the part of the operator. **Anyone can operate the "Hendey Miller."** No special skill is required to get the service that the Hendey's built for.

**Write for the "Hendey Miller" Book.** It is certain to interest you.

# Starrett Combination Set

A Starrett Combination Set is a complete instrument based on the original combination square invented and patented by L. S. Starrett. It combines on one grooved blade or rule three sliding heads as follows: A square, a protractor, and a center head.

## Where Used

The tool may be used with any of these heads singly or in combination. It is useful in laying out all kinds of work, especially jigs, dies, etc., and in testing progress as work is done. There is a spirit level in the head of the square and also a scriber for laying out work.

## Quality of Graduations

The blades of Starrett Combination Sets are graduated by the special Starrett process, which insures cleaner, sharper, finer graduations than is possible with any other method.

## Two Styles

These Combination Sets are made with cast iron heads or drop forged heads, as preferred. The drop forged head is hardened and is more durable but is also more expensive. The graduations on the blade are metric or English, as preferred.

## Sizes

The tool is made in the following sizes: 9″, 12″, 18″, and 24″, with prices from $3.75 to $5.75, depending on size and style.

# The Tap with the Con-eccentric Land

## For Tapping Nuts

**One-third of the land from the cutting edge is concentric. The remaining two-thirds has eccentric relief.**

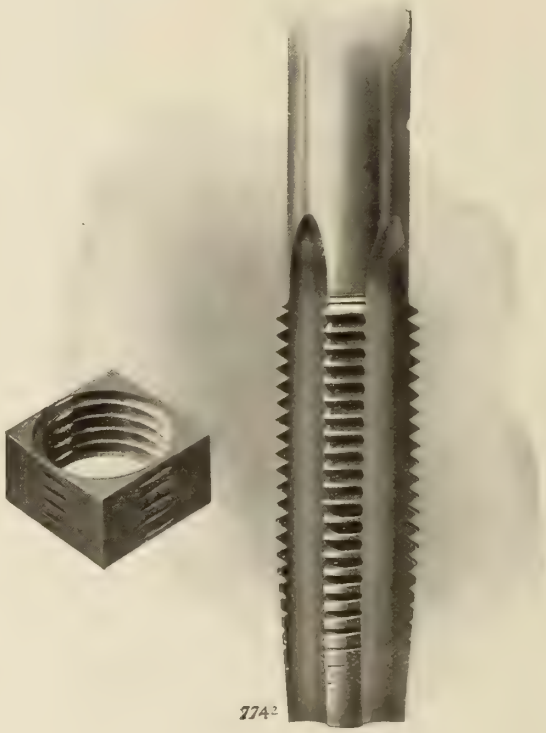
TO show more clearly the free-cutting qualities of these taps, a nut slightly smaller than one and one-quarter inches square was drilled for tapping and held lightly by the corners. The nut was then tapped with a 1¼-7 U.S.S. con-eccentric tap, driven through without reversing. (See cut on right).

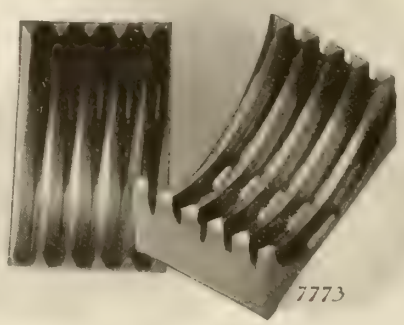
So perfect were the cutting qualities and so easily and freely was the work done that this mere shell of a nut was *not even distorted,* to say nothing of being split as would have happened with a tap differently constructed.

Consider what this means to the nut manufacturer from the standpoint of a *saving in power.* This is but one reason why Pratt & Whitney taps are specified by the largest nut manufacturers in the country.

For a number of years we have made taps with this style of relief. They have won out steadily and consistently on merit alone.

**Write for our Booklet "The Tap with the Con-eccentric Land."**





TAPS can be sharpened at the only correct point — on the face of the cutting edge.

Sharpening in no way affects their size.

Can be sharpened long after other so-called eccentrically-relieved taps are rendered useless.

We obtain the freest cutting tap with the longest life—an exclusive combination.

Accuracy nowhere else obtainable is secured together with a degree of finish and refinement heretofore thought impossible in a commercial tool.

We want tap users to know *why Pratt & Whitney taps are best,* also that our claims are based on reasons mechanically correct.

Cut to left is a tapped nut sawed in half showing small area of metal which held it together.

The taps are carried in stock by our Branch Offices and Agencies throughout the world. Prompt service assured to all customers wherever located.

## THE VALUE OF A NAME

Flood, or fire, or adversity may threaten, and even destroy the material assets of any business, but it will take more than fire or flood to burn or drown a *good name well advertised.*

Nothing can take away from any man or any firm the inestimable value of a name that has been well established, and when it stands for good goods and satisfying service.

Successful business men realize this fact and seek to perpetuate their names by persistent advertising in suitable mediums like CANADIAN MACHINERY.

They have good products back of their good name, and good service back of both.

It is natural to remember an advertised name, and, when you come to think of it, it is a good thing it is.

*Rate cards and full information will be sent on application.*

# Electric Hoist at Mountain Park Railway, Hamilton, Ont.

*The accompanying illustrated descriptive article features a species of power plant equipment well removed from the beaten path of either hydro-electric or steam power generation. In its essence and service, the installation relates more especially to power transmission and application achievement of a rather uncommon nature, yet dealing with a valuable and highly appreciated means of transportation peculiarly local in its purpose and demand.*

THE Hamilton Mountain Park Co., Ltd., of Hamilton, Ont., recently installed a new electric hoist, with interesting and novel features, to operate their incline railway which gives access to the large tract of land they have acquired at the top of the mountain and to the fertile country beyond. The "Mountain," as it is called, is really the Niagara escarpment, the steep bluffs behind Hamilton being a prolongation of the heights at Queenston, over which the Niagara River originally flowed, before cutting back the gorge to the present falls. The difference in elevation between the general level of the city and the plateau back of the bluffs is 325 feet, and as the roads leading up the bluffs are few and necessarily steep, the incline in question does a very large business in transporting passengers, automobiles, teams, etc.

The original steam hoist used for this purpose became utterly inadequate to handle safely and quickly the rapidly increasing traffic. The present installation is modern in every detail and is equipped with numerous automatic safety devices which, so far as is humanly practicable, will prevent any possibility of accident. The contract for the complete equipment was taken by the Canadian General Electric Co., Toronto, Ont.

### Hoist Type and Capacity.

A special double fixed drum, double geared electric incline hoist built by the Lidgerwood Co. of New York, and represented in Canada by Canadian Allis-Chalmers, Limited, operate two cars in balance on an incline of 800 feet long, with a grade of 40.27 per cent. Each car weighs 30,000 lbs., and runs on tracks having a gauge of 12 ft. 1½ ins., the centre to centre of tracks being 20 ft. 3 in. The average load on the cars will be about 20,000 lbs., with a maximum load of 30,000 lbs., and the hoist arrangement is suitable for either hoisting the maximum load with empty car descending, or for lowering the maximum load with the empty car ascending.

The time required for making a single trip is 1½ minutes, and the rest period between trips will be 3 minutes. Attached to each car are two ropes of 1⅝ in. diameter, each rope weighing 4.15 lb. per ft. One of these ropes is used for hauling the car, and the other for the purpose of safety. The average rope speed during the run is 585 feet per minute.

### Incline Arrangement.

The hoist is located in a house 106 ft. from the knuckle between the incline and the level of the summit, and the main rope from the right hand car is wound over the top of the right-hand hoist drum, while the main rope from the left-hand car is wound underneath the left-hand hoist drum. The safety rope from the right-hand car is led over suitable deflecting sheaves to the top of the left-hand drum, and the safety rope from the left-hand car is wound over suitable deflecting sheaves to the bottom of the right-hand drum. Each of these sheaves is 7 ft. in diameter to the bottom of the rope groove, and weighs 3,500 lb. There are 4 head sheaves and 4 deflecting sheaves, making 8 in all.

The head sheaves are arranged vertically so as to carry the hoist ropes and safety ropes in a direct line from the

MOUNTAIN PARK RAILWAY, HAMILTON, ONT.—VIEW FROM MOUNTAIN TOP.

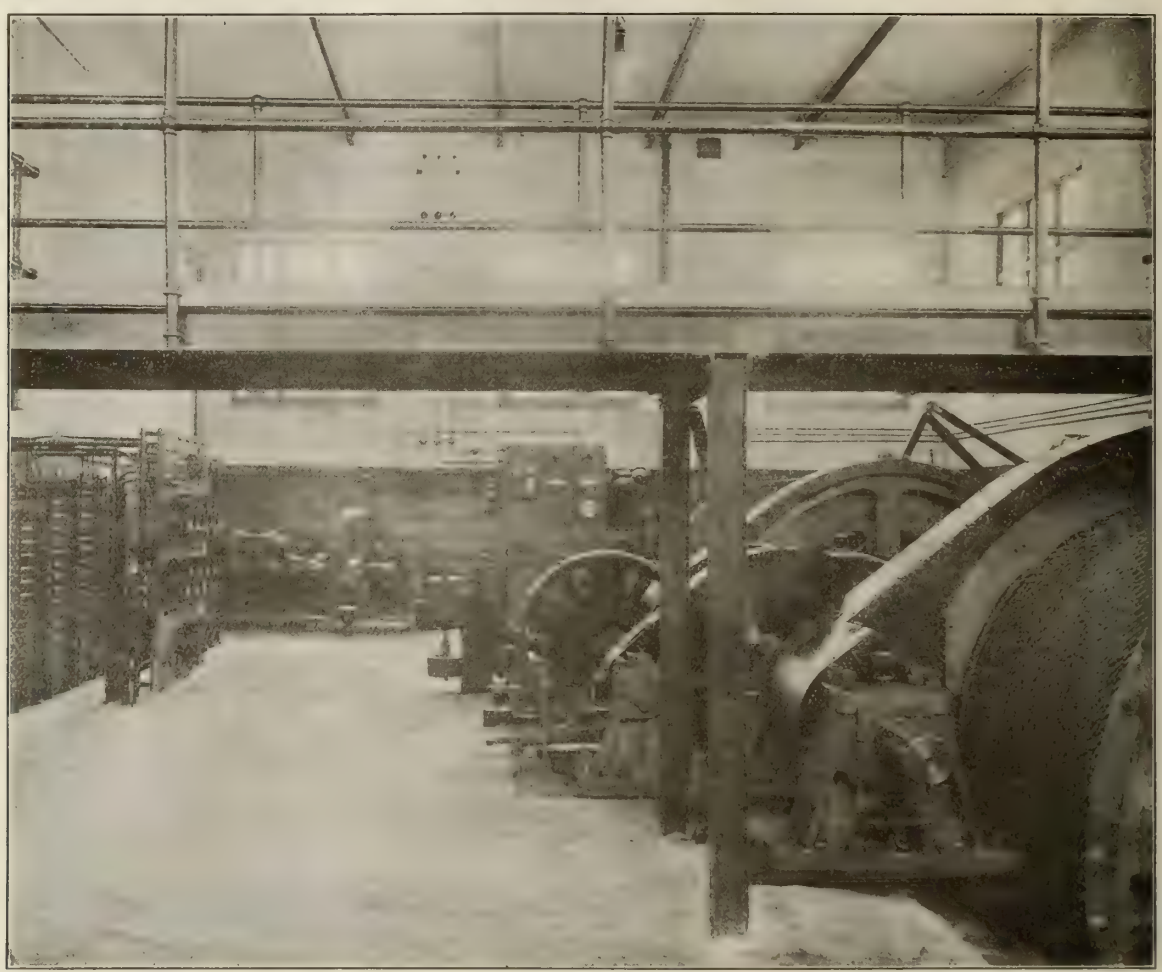
cars, while the deflecting sheaves are placed horizontally at such an angle that the rope will be led in a direct line to either the top or bottom of the hoist drums, as the case may be. Floating sheaves are also furnished to guide the ropes and are placed in the rope tunnels between the head sheaves and the hoist drums. The reason for reeving the safety ropes as outlined above is that, in case of an accident to the left-hand side of the hoist, the safety rope on the left-hand car would take care of it properly, being on the right-hand drum; the same thing would apply if the other drum of the hoist should become disabled; that is, the main ropes and the safety ropes from each car lead to opposite drums.

Further advantage is gained by the fact that each drum is equipped with an independent double-acting brake, and in case either of the main ropes should break, the safety rope will hold the cars. Again, the safety rope if called upon to take the load, will be controlled by all the automatic brake features in exactly the same manner as when the load is being handled by the main ropes. In actual operation, the length of the safety ropes will be slightly more than that of the main hoist ropes, thereby relieving the safety ropes of any hoist stresses other than those required to keep the ropes themselves in motion.

### Operation and Safety Appliances.

The operator's cabin is fitted with one electric control and two hand brake levers, but the levers will not be used ordinarily, as the hoist is equipped with solenoid brakes operating on the motor shaft. The hand brakes, therefore, need only be used for the locking of the cars at the top and bottom positions, or for cases of emergency. In starting a run, the operator releases the drum post brakes by the hand levers, puts his foot on the small foot pedal located at bottom of master controller and by moving the handle of the controller to either the right or the left, as the case may be, the cars will start and will automatically accelerate to the normal rope speed. At a predetermined point on the incline, the controller handle will be automatically turned to such a position that the speed will be cut down to 1-10 of the normal, and finally be turned to the off position, thus setting the solenoid brakes and bringing the cars to rest. Should the operator become disabled during a run, he will of necessity remove his foot from the foot pedal, thereby cutting off the current, bringing the cars to rest. In order for the cars to move, the operator's foot must be on this pedal.

In case the cars should stop short of their landing position, due to the automatic over-winding mechanism, there are available two or three points on the controller, so that the operator can bring same to their proper positions, and should the cars fail to stop due to the fault of controller, an over-winding device is attached which will shut off the current and set the solenoid brakes. Should the speed of the cars exceed the normal by a predetermined amount, an over-speeding device is so arranged that it will trip a weight of 570 lb., which will set the drum post brakes. This over-speeding device or governor is of the fly-ball type, and it will be caused to operate by an excessive speed, whether due to motor or a breakage of the hoist parts. The emergency weight may also be tripped manually from the cabin.



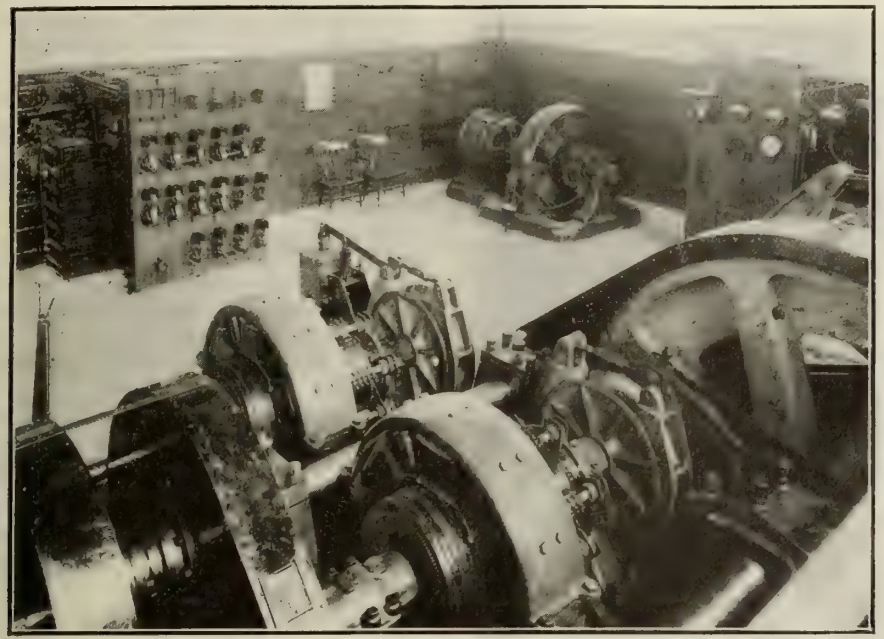
GENERAL VIEW OF POWER HOUSE MOUNTAIN PARK RAILWAY, HAMILTON, ONT.

### Bedplate.

The bedplate, embedded in a concrete foundation, is composed entirely of structural steel, and is approximately 32 ft. long and 18 ft. wide. The main members are made up of two I beams 15 in. high, fitted with suitable spreader plates top and bottom, and thoroughly braced

and riveted. The cross members are composed of 15-in. I beams and 15-in. channels with top and bottom plates suitably riveted.

Where the pillow blocks, side-stands, etc., are mounted on the bedplate, pads are riveted to same and planed so that the various parts of the hoist will line up properly. The bedplate is built in 8 sections to facilitate shipping, the sections being joined together by means of suitable riveted plates, angles and forgings, and by means of fitted machined bolts.



ELECTRIC HOIST SHOWING CONTACTOR PANEL, MOTOR GENERATOR SET AND SWITCHBOARD.

### Bearings.

The drum shaft is carried by four low form pillow blocks of cast iron which are 14 in. high from the base to the centre of the shaft, and fitted with adjustable caps. The outer pillow blocks have bearings 12 in. diameter and 18 in. long, while the two other bearings are 12 in. diameter and 20 in. long. The pillow blocks are secured to the bedplate by means of fitted bolts and are provided with suitable keys at each end for purposes of alignment.

The pinion shaft is carried on three A stands 21 in. high, which are of the same general construction as the pillow blocks, excepting that they are not fitted with alignment keys. These A stands have ring oiling bearings 7 in. diameter and 12 in. long. There are also provided ring oiling A stands to serve as outboard bearings for each of the motor armature shafts. These A stands are also ring oiling.

All the bearings are lined with babbit metal which has been thoroughly peened in place, machine bored and hand lapped. All the bearings are equipped with suitable oil wells or cups, and the main pillow blocks are fitted with oil trays to prevent leakage on the foundation.

### Shafts.

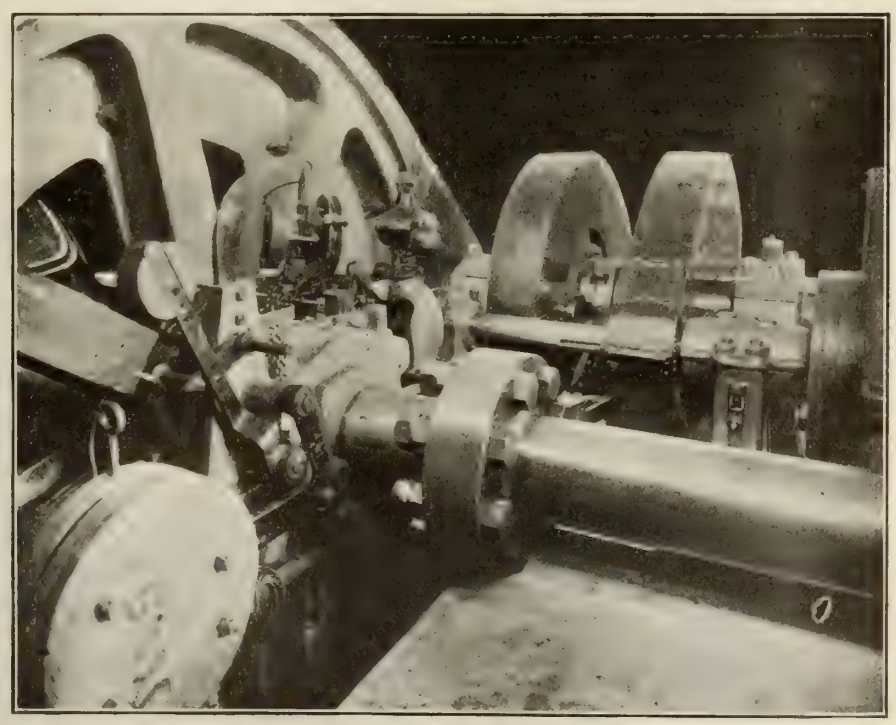
The drum shaft is a steel forging made in two pieces, which are 12 in. diameter. The two pieces are joined together by means of heavy flanges forged integral, and fitted with heavy machined bolts. The drum shaft, including the two sections, is 32 ft. long, and weights 13,300 lb. The intermediate shaft has been machined from a single steel forging and is 7 in. diameter throughout its entire length. It is 20 ft. long and weighs about 3,000 lb.

### Drums.

There are two cast iron drums 96 in. diameter by 70 in. face, to coil 800 ft. of 1⅝-in. rope, plus 3 holding coils at each end on one layer. These drums are made up in 2 sections, of barrel construction, and are bolted at one end to the post brake ring, and at the other end to the drum gear. The two sections weigh each 8,350 lb., which means a total weight of drum barrel for each drum of 16,700 lb. The drums have a series of heavy reinforced ribs parallel to drum face and extending from flange to flange.

### Drum Gears and Pinions.

Each of the drum gears is made of cast steel with cut involute teeth, and is of the double arm wheel type having eight arms reinforced by ribs forming an H section. The gear has 122 teeth of 1 d.p., and a 12-in. face width, the pitch diameter being 122 in. As mentioned before, the gear is bolted to the drum barrel by fitted bolts with double nuts. The gear pinions are of forged steel and contain a very heavy brass bushing having a slide fit on the intermediate shaft. The pinions have 21 teeth, 1 d.p., and a 12-in. face width, being 21 in. pitch diameter. The gears weigh 11,900 lb. each, and the pinions, including the brass bushings, weigh 1,200 lb. each.

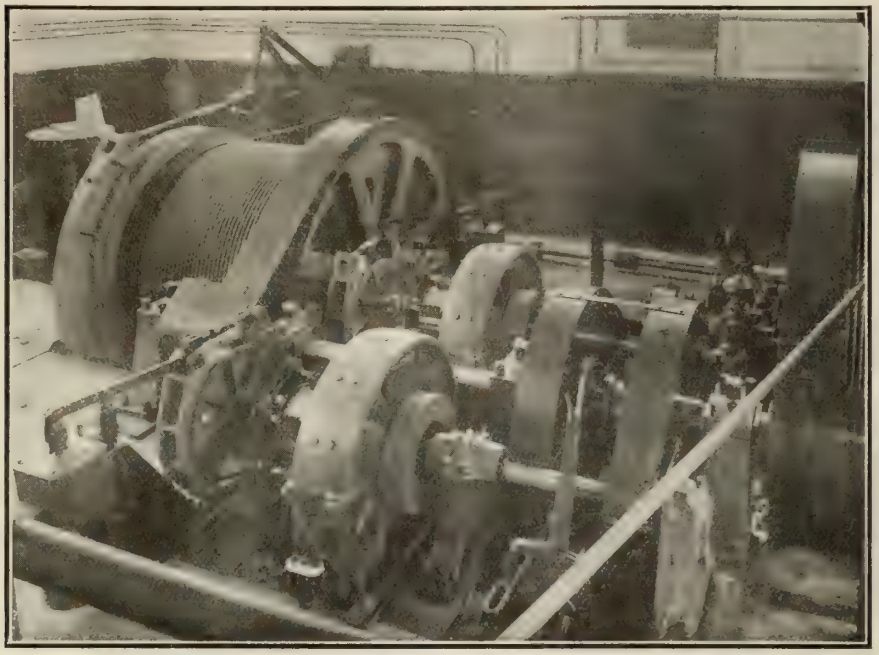


ELECTRIC HOIST SHOWING FLYBALL GOVERNOR OVERSPEED DEVICE.

### Intermediate Gears and Pinions.

The intermediate gears are of cast steel with cut herringbone teeth. They have 113 teeth of 3 d.p. and an 8-in.

face width, being 56½-in. pitch diameter. The intermediate pinions are of forged steel and have 22 cut teeth of 2 d.p., herringbone type. They are of 8 in. face width, and are 11 in. pitch diameter. The gear is of the double arm wheel type, and contains a brass bushing. The gears weigh about 1,630 lb. each.



ELECTRIC HOIST SHOWING BOTH MOTORS, SOLENOID BRAKES AND FLY-BALL GOVERNOR OVERSPEED DEVICE.

### Drum Brake Wheels.

The drum brake wheels are of cast iron and are of the double arm wheel type, having 8 arms. They are fitted for post brakes of the V type and the angle between the sides in contact is 68°. The wheels are 108 in. in diameter to the outside of the rim, and as stated above, are bolted to the drum barrels with turned bolts and double nuts. Their extreme width, except at the hubs, is 12 in., and they weigh 9,000 lb. each.

### Drum Post Brakes.

The two main drum post brakes are of the double acting type, the wings being composed of cast steel, fitted with V-shaped white maple blocks 10 in. wide, cork inserted. The lower ends of the brake are carried on a cast iron sole plate which in turn is supported by a cast iron plate embedded in the hoist foundation. The sole plate is secured to the foundation plate by means of fitted machined bolts, and in addition there are provided steel keys for the purpose of further rigidity and alignment. The brake is applied by closing the brake wings at the top, which is accomplished by means of suitable bell crank with adjustable connections. Ordinarily, as mentioned before, the setting of the brakes will be accomplished by two hand levers located in the operator's cabin, but in case of emergency, by means of the over-speeding device.

### Solenoid Brake Wheels.

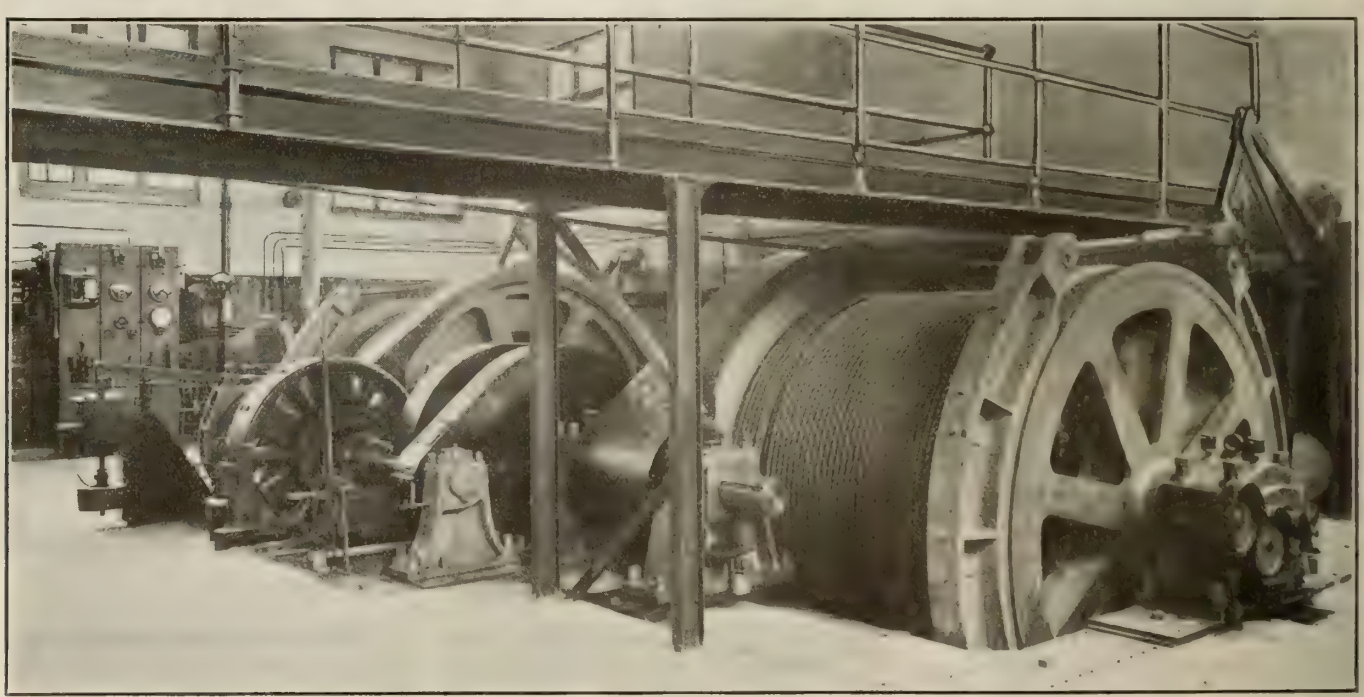
The solenoid brake wheels are of cast iron and of the solid plate type, reinforced by 8 ribs, and fitted for post brakes of the V type, the angle between the sides in contact being 75°. The wheels are 34 in. in diameter to the outside of the rim, and weigh 830 lb. each. Due to the high r.p.m. of these wheels, they are very carefully balanced.

### Solenoid Post Brakes.

The two solenoid post brakes are of the double acting type, the wings being composed of cast iron having a V-shaped section lined with raybestos brake fabric. The brakes are set by C.G.E. solenoids, type C.R. 9,500, size S-6-200 lb., having a 5-in. stroke and being series wound for 500 volts with ½-hour rating.

### Clutch and Arrangement for Operating Same.

As only one motor will be in operation at one time and two are provided in case of the inability of one to perform its duty, an arrangement is necessary to shift the drive from one motor to the other. This has been taken care of by



ELECTRIC HOIST SHOWING GEARED LIMIT SWITCH ON DRUM SHAFT AT RIGHT, AND INTERPOLE MOTOR AND SOLENOID BRAKE AT LEFT.

a jaw clutch located on the intermediate shaft, which engages with either one of the gears by means of clutch plates, thus transmitting the pinion force to the intermediate shaft, the gear being loose on the shaft. The clutch is shifted by a lever operating in a notched quadrant, and two clutch-locking levers balanced by weights are provided in conjunction with a small plate attached to the clutch lever which prevents the clutch from working out, and positively locks clutch in position.

**Electrical Equipment.**

Power is supplied in the form of 3-phase, 25-cycle, alternating current, and for transforming this to direct current a Canadian General Electric motor-generator set has been installed of sufficient capacity to supply the average demand of the hoist, plus some surplus for charging the battery described below. The direct current end of this machine is rated at 165 amperes continuously at 550 volts, the latter being the floating voltage of the battery. This generator is driven by a 2,200-volt induction motor. The generator end is designed with a special drooping characteristic, by means of a reversed series field, for the purpose of throwing load fluctuations on the battery. A small percentage of the load fluctuations falling on the machine will lower its voltage to such an extent that the battery must discharge and furnish the balance of the momentary demand. The regulation is, therefore, inherent in the design of the machine, and is entirely automatic.

The hoist is driven through two gear-reductions, the total ratio of which is 29.84 to 1, by a General Electric 189 horse-power, 500-volt, 475-585 r.p.m. direct current motor which is especially designed to stand such voltage variations as come from a storage battery when it is frequently charging and discharging. The motor is controlled by a General Electric magnetic contactor panel, so that it is convenient to control the motor remotely from the operator's station. This system control admits of the various protective devices already described, and ensures against the cage operating at greater than a predetermined speed. A General Electric master controller and foot-operated safety switch are installed in the operator's cabin.

To ensure a greater degree of continuity of service, a reserve General Electric 180-h.p. motor and solenoid brake are provided. The machinery of the hoist is so constructed that in a very few moments' time one motor can be disconnected from the hoist and the other clutched-in ready for service. The power plant has been supplemented by a storage battery built by the Electric Storage Battery Co. of Philadelphia, one of the objects of installing this being to reduce the maximum peaks due to the fluctuating load of the hoist, and thus reduce the power bills. Another object was to furnish current for operating the hoist if the alternating current supply is interrupted.

The demand of the hoist motor when lifting a load of 7½ tons was estimated at 470 amperes for ten seconds, followed by a demand varying from 410 down to 230 amperes for a period of 80 seconds, the voltage being approximately 550 volts. Under the conditions of maximum schedule, it was estimated that the load period of 90 seconds, mentioned above, would be followed by a 3 minute rest, thus providing for a trip of the hoist every 4½ minutes.

For handling a 10-ton load, the maximum ten-second demand was estimated at 530 amperes followed by 80 seconds of load varying from 470 down to 310 amperes. The hoist is designed to handle a 15-ton load occasionally, but this will not occur when the battery is handling the entire load with the power supply cut off. It is believed that hoisting a 7½-ton load every 4½ minutes will represent the average conditions during the hours of maximum traffic. The average load is 112 amperes on this basis.

**Storage Battery.**

The battery consists of 262 cells of the Tudor-Box type. Each cell contains 11 plates, Type F., measuring approximately 11 in. by 10½ in., five of the plates being positive of the Tudor type and six of the plates being negative of the Box type. The plates are supported in glass jars mounted on glass sand trays, the entire battery being installed on wooden racks. The capacity of this battery is 200 amperes for one hour on continuous discharge. For intermittent service extending over several hours the ampere hour capacity will be somewhat greater, and it is estimated that this battery will operate the hoist under the average load conditions cited above over 1¾ hours with the power supply entirely cut off; or if the schedule be reduced so that trips are made less frequently, the hoist can probably be kept in operation for several hours.

Under normal conditions with the motor generator supplying the average load, the battery does not become exhausted, but receives back sufficient charge during the period of rest between trips to make up for the discharge while the hoist is in operation. The battery, therefore, while relieving the motor generator and power line of the severe load fluctuations, is maintained at all times practically full and ready to supply the entire demand in case of interruption to the power supply.

## CANADIAN RAILWAY CLUB ANNUAL.

THE thirteenth annual meeting of the Canadian Railway Club, Montreal, was held last week, when reports of the past season's work, the election of officers, a presentation to the retiring president, etc., constituted the principal business transacted.

Officers were elected as follows: President, L. C. Ord, C. P. R. Angus Shops; first vice-president, R. M. Hannaford; second vice-president, George Smart; executive committee, Messrs. T. C. Hudson, E. E. Lloyd, J. Hendry, C. Manning, E. B. Tilt and Prof. H. O. Keay; audit committee, Messrs. W. S. Atwood, W. H. Winterrowd and W. S. Purdy; secretary, James Powell; treasurer, W. H. Stewart.

The annual report of the secretary showed that the attendance at the monthly meetings had been the best in the history of the club and that the membership had now amounted to 800, of whom 73 had joined during the twelve months. The loss sustained by the death of Lieut.-Col. Lacey Johnson was referred to in appropriate manner, and the secretary drew attention to the fact that four other members had died during the year.

The financial statement showed that the club has a balance of $3,063.91. While this is slightly less than the balance shown at the last annual meeting, it was explained that the dues of all members who had gone to the front had been remitted. Those serving with the forces are Messrs. W. C. Brotherhood, J. M. Eakins, P. H. Henson, W. T. Hawes, L. G. McNab, F. G. Goddard and J. R. Thomas.

On behalf of the membership, T. McHattie presented to the retiring president, William McNab, a gold medal commemorative of his term of office, in acknowledging which Mr. McNab declared that it would be a reminder of one of the most pleasant years of his life. At the smoking concert which followed, Messrs. J. T. R. Hicks, Sam Dunn, H. W. Hesketh, J. Aspinall, J. Hunter and C. Kelso were heard in songs and recitations.

An interesting point was brought out at the recent sales conference of the Goodyear Tire & Rubber Co., Akron, Ohio. The company's statistician announced that each of the 500 salesmen sell enough goods to keep 15 workmen on the payroll at Akron. The company employs 7,500. Most of these are married, and the statistician figuring an average of two dependents per workman shows that Goodyear salesmen produce means of life for 22,500 Akron people.

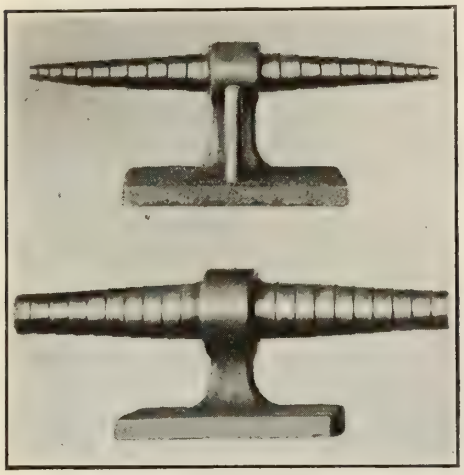
## CONVENIENT FORM OF CALIPER GAUGE.

By J. P. S.

IN spite of the fact that solid gauges and micrometers are being used more and more in gauging standard sizes, the old-fashioned caliper is still very much used, and when equipped with suitable gauges possesses some advantages. The essential point in accurate measuring with calipers is an educated sense of touch. The skilled mechanic measures thousandths by the feel, and not by adjustments of the instrument.

It is very difficult for even experienced men to take accurate sizes from a scale or even from a micrometer. For convenience, quickness, and accuracy in this work, it is best to provide a gauge similar in general form to the work to be measured, so that the feel of the caliper may be the same on both gauge and work. Two such gauges are shown in the accompanying illustration, and are



STANDARD CALIPER GAUGES.

in continuous use in the plant of the Canada Machinery Corporation. Although not a new idea, these gauges have been found to prevent considerable spoilt work and to make possible accurate measurements from men who were otherwise more or less uncertain.

These gauges may be made up in sizes suitable for the range of work of the plant using them. We have seen them with each step representing a standard size of shafting, and each step subdivided for running, push, and force fits, a line representing the centre in each area. Another decided improvement is to fit a ring on the ends larger than the smallest diameter to protect the tool from injury by falling and injurious contact with other tools or machinery.

## SLOTTING SCREW HEADS.

By G. Avery.

A FIXTURE used for slotting screw heads is shown in Fig. 1. By using this device, screws can be slotted almost as fast as the operator can handle them. The fixture is bolted to the milling machine table and set so that a milling saw will run in the slot A at the right height to properly slot the screw heads as they are fed under it. The screws are inserted at B by the left hand of the operator while his right works the lever C. The stroke is such that, when the lever is pulled forward as far as possible, a cut is completed on one head. No clamping device is needed as there is no tendency of the screws to spin or chatter to any extent. In order to show the simplicity of this fixture, it is shown in Fig. 2 with the top cover of the holding slot removed. As fast as the screws reach the end of the holder they drop off into a box set to catch them.

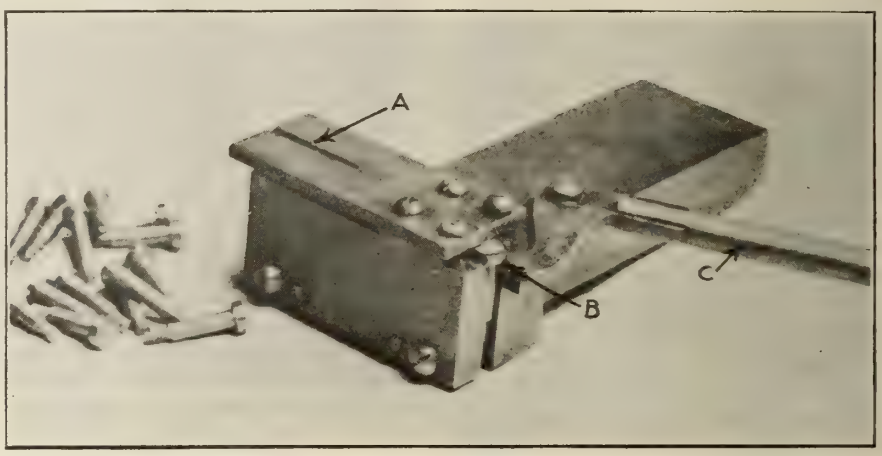


FIG. 1. SCREW HEAD SLOTTING FIXTURE.

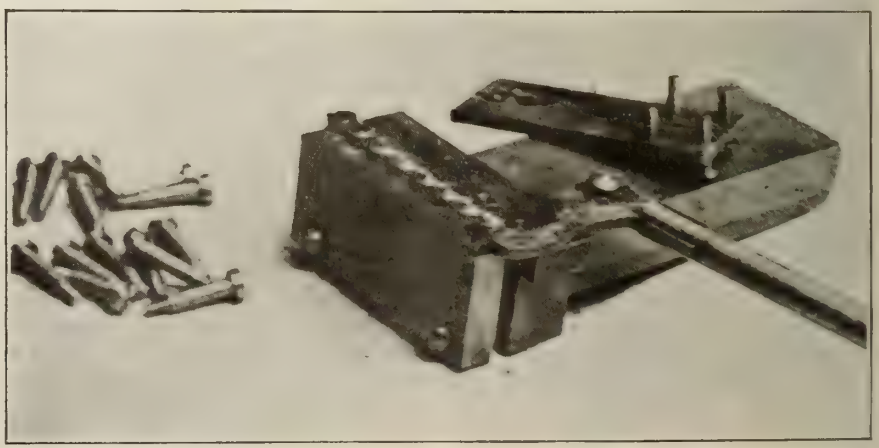

FIG. 2. SCREW HEAD SLOTTING FIXTURE WITH TOP COVER REMOVED.

## PIPE PATTERNS AND CASTINGS.

By A. Midgley.

THE accompanying article formed the subject of a lecture recently before the Halifax Branch of the British Foundrymen's Association. Patterns and castings were discussed relative to straight pipes, standard tees, elbows and specials.

### Straight Pipes.

For a few years there was in use at the foundry at which the author was employed a range of wood models varying from 4 in. in diameter to 24 in. diameter. The patterns up to 9 in. diameter were made in two solid halves jointed and dowelled. The flanges were made to fit the diameter of the prints, this being better than recessing them into the print when the pipes were subject to con-

stant alteration. The prints were 6 in. long, and in those sizes of pipes which were most in use, several lengths were made, 9 ft., 6 ft., 3 ft., 2 ft., 12 in. and 6 in. Thus it was possible to avoid extra long boxes for short pipes and also to make a great many pipes of the same diameter, but varying in length, on the same day.

Above 9 in. diameter the pipe patterns were lagged up on bearers or circular blocks, these blocks in most cases being gussetted on one side in preference to crossing the grain at right angles as believed to be the usual practice. By this method, the diameter of the pattern remained more correct and for a longer period than by crossing the grain. Care should be taken to have the gussets at least as thick as the timber used for the bearers. These patterns served their purpose for a number of years, but as the number of pipes required increased, it was decided to lay down a range of iron models from 4 in. to 9 in. diameter inclusive, with suitable boxes, and these proved a decided advantage.

The iron models were made in 9-ft. lengths with due allowance for contraction and machining. They were turned up to correct diameters all over, flanges included. The flanges were recessed into the pipe at each end ¼ in. below the diameter of the print, this ensuring that they sat perfectly true on the pipe without being fastened. The prints were respectively 9 and 12 in. long, the longest coming well out of the end of the box and having 1½-in. diameter hole drilled through, this hole enabling the moulder to insert a bar and give the pipe a slight turn before removing the top part, thus breaking any adhesion that might exist between the pattern and the sand and giving a perfectly clean and satisfactory mould.

Where square or rectangular flanges had to be used they were provided with a centre dowel and suitable hole in the recess of the pipe to ensure that each flange would be square with the other, also all flanges were provided with a fillet, as the absence of these would sometimes cause the flange to draw away from the body of the pipe. Fillets should never be made so big as to interfere with bolt heads.

### Standard Tees and Elbows.

These were used in great variety. They were all wood models with half core-boxes, and it had been found that very seldom was more than half needed, especially when the elbow or tee was set equal either way. These were made in the usual way, and scarcely required describing.

### Specials.

Great numbers of these were made, spring bends, S-shaped bends., Y-shaped bends and almost every shape of pipe known to the trade. A series of large pipes including taper pipes and elbows tapering from 39 in. to 36 in., some with flanges at both ends and some with one flange and bell-shaped at the other end had just been finished at the author's foundry.

In handling these pipes, the same method was followed as adopted with template pipes. Formerly when a template pipe order was received from the drawing office, although all the information possible was given, there was much left in doubt. A template pipe was a pipe which had to fit between two existing pipes, and if the angles of the flanges were not correct, when being put into its final position on the job a great amount of work was caused.

On receiving the template, the practice formerly was to try and place it in a position of a level board approximating to the position it would finally occupy. When put into its place on the job for which it was intended that was not always easy, as sometimes very difficult angles had to be obtained. Although generally successful in this part, it was still necessary to transfer those angles and measurements to the loam patterns, a proceeding which was found to be decidedly awkward. A loam pattern was not the best material on which to fasten flanges that needed to be accurate, and although a great amount of thought and ingenuity was devoted to the matter only indifferent success was attained, for however accurately the flanges might be placed on the loam pattern there was always the danger of these being disturbed before they were finally rammed up in the mould. The present method of dealing with template pipes was:

### Improved Method Adopted.

The total length of the template was measured to decide the amount of contraction required, and any special features were noted. Next half-circular pieces were prepared to fix on each flange, these pieces being made thick enough to provide for contraction and a definite amount of machining in the total length of the pipe. To these were affixed half-circular prints made to the size of the box of the pipe. In fixing these to the template, care had to be taken to see that they were parallel on the joint, as by so doing a perfectly true joint was ensured.

The next procedure was to make a core-plate to follow the contour of the pipe, from which plates were cast and from which the coremaker struck up the loam core, afterwards striking the required thickness of loam on to make it the size required for the pattern. Two strickles were prepared, one for the core and one for striking on the thickness of loam for the metal.

Assuming that the core and pattern were ready the moulder bedded the template into the floor in the ordinary way, rammed up to the joint of the flanges, and there made a joint half-way (round the flanges only). Two stakes or files were then driven into the sand against the outside face of the flanges, these being allowed to project against the joint in order to ensure the top half of the flange following the same angle as the bottom half.

The template was then drawn out of the sand and two half-flanges were dropped into the impressions left by the template. The loam pattern was placed between the two flanges, the top halves of the latter being placed on the top of the pattern and rammed up in the ordinary way. When the pattern was liberated by the moulder, the extra thickness allowed for metal was taken off, leaving the core, which was now dressed off ready to go back into the mould. This method was found to be more sure and much easier than any other they had tried.

## ORGANIZING THE ENGINEERING INDUSTRY IN WAR TIME.

CONSIDERABLE attention has recently been devoted to the organization of engineering, shipbuilding and metal working plants in Great Britain with a view to their meeting satisfactorily the abnormal demand not only for the actual munitions of war, but for the equipment, as well, necessary for the production of the latter. Arising out of broken time of workmen, from causes known and in many instances grossly exaggerated, and from causes real but unappreciated, steps have been taken to bring under Government control and dictum the output feature in a quite broad and comprehensive sense. The following article, taken from a recent issue of The Times, London, England, emphasises the need of caution being exercised in the cessation of normal or peace-time specialty production, and shows that, while it is realized that the supply of war munitions must be paramount, nothing should be done that will be detrimental to set back or nullify legitimate work:

I am the chairman of an engineering concern which is engaged exclusively in the manufacture and importation of machine tools—machines and appliances used for the various metal-cutting operations which are required in the production not only of munitions of war, but of all machinery; and as such I have had access to practically all the engineering works of the country, and have learnt much of the conditions in

the various branches of the trade and of the problems and difficulties with which the industry is faced. Any attempt to organize the engineering industry must operate on the broadest possible lines, dealing first with the means of increasing the total output, and then with the difficulties of detail.

**An Organizing Council.**

The first step necessary is the formation of a body truly representative of the various departments. Such a body, which might be called an organizing council, should comprise first of all representatives of the two great departments by whom the present demand is initiated—namely, the Admiralty and the War Office. It should comprise a representative of the treasury to deal with finance, one or more strong commercial men with wide experience, one or more practical engineers conversant with manufacturing operations on a large scale, and one or more labor representatives. It should possess the fullest powers, but it should avoid until the last any unnecessary interference with existing management, realizing that our engineering resources if fully and intelligently employed are capable of extending the present output in an extraordinary degree.

The engineering industry must be considered to embrace all metal-producing and metal-working industries, and to comprise such vastly different branches of trade as production of pig-iron; steel in its multitudinous varieties; ships; constructional steel work; guns, small arms, shells, ammunition; locomotives; marine, stationary, gas and oil engines; motor cars, bicycles, machine tools. Each of these trades is highly specialized, and almost all depend on the uninterrupted working of allied trades. Specialized trades take time to build up, their organization and equipment cannot, except in few instances, be rapidly diverted to other purposes, and the organizing council, therefore, should interfere as little as possible with them so long as the Government demand for their productions is unsatisfied.

Take the case of a company specialized for the manufacture of machine tools for use in the armament trade and in the engineering trades as a whole. Such a company possesses a large amount of plant which undoubtedly could be diverted from its legitimate functions to the manufacture of shells, fuses and other direct munitions of war, but its total output on these new productions would be insignificant and long delayed. Meanwhile, the buyers of machine tools, practically the whole industry, would be at once embarrassed.

**Objects of the Moment.**

It may be presumed that the main requirements of the moment are:—

1—To increase the output of warlike material of every kind.

2—To make such increase in the least possible time.

3—To interfere as little as possible with existing management and methods.

The organizing council would find an immediate necessity for local sub-committees, who would have to collect information as to local conditions and possibilities, digest such information intelligently, report to the organizing council, and act as local executives. The Engineering Employers' Federation, which comprises the bulk of the most important engineering firms and has local committees in all engineering centres, would undoubtedly offer its services.

The organizing council might at once decide and declare the attitude to be adopted with regard to machinery and engineering supplies which are in progress for neutrals and Allies, and are now naturally taking their ordinary course. No doubt the Government would hesitate to interfere with work for Allied Governments and their contractors, but the supply of engineering goods to neutrals might probably be interrupted without compunction, and would release considerable quantities of engineering products for the British Government or by their contractors. Many workmen and much material would also be released. The same applied to large orders in hand for departments in the British colonies which are not concerned with the war, and to orders for municipal work. Since it was only after some weeks that the demands of the Government began to be really felt, engineers, if they have to suspend deliveries to neutrals and to other customers, must be protected against claims for breach of contract.

**Classification of Resources.**

Again, the organizing council would co-ordinate the respective requirements of the Admiralty and the War Office so as to avoid independent action by the two departments. This would clear the air at once and greatly increase output. Reports presented by the local committees would deal with the capabilities of each district firm, the amount of orders already in hand for Government work, and the amount of orders in hand for other purposes. On the basis of these reports the organizing council would classify the engineering firms of the country somewhat as follows:—

A—Government establishments. B—Establishments engaged exclusively, or almost exclusively, on the direct production of munitions. C—Establishments engaged partly on Government work. D—Establishments doing little or no Government work. The leading idea would be, in the first instance, to assist A and B by bringing to their help the full resources of C and D. These reports would be far better than the information at present collected by factory inspectors.

**Labor and Efficiency.**

Labor will also engage the attention of the organizing council, who would not be influenced towards it by isolated difficulties. It must be realized that the Government are largely responsible for the present labor difficulties by devoting all their earlier energies to enlistment, and by collecting to the colors thousands of the best mechanics. This has resulted in a grave deficiency of labor, which can only be gradually supplied by bringing in and training new men (and in many cases women). While there are isolated cases where production is interfered with by drink, where workmen are unreasonable, and where restriction of output for the purpose of maintaining prices is resorted to, it would be wrong to conclude that such difficulties are universal, and it would be unjust to withhold from the workers as a whole due acknowledgment of their hard work.

The depleted labor market might also be fed to some extent by the suspension of public and municipal works. The congestion of railway traffic, and particularly the congestion at the docks, needs prompt handling. Bodies of troops under training might be utilized in cases where dock workers refused to put in proper work, and the removal of congestion would at once expedite transport work, and free immense supplies of machinery and munitions which are reaching us by sea.

The organizing council could then turn to the equipment of new establishments for the production of further supplies of munitions, as soon as it was assured that existing establishments had really been assisted to increase their output to the maximum and that machinery, material, and labor were ready.

The British War Department is looking around for gases to use against the Germans. The Toronto Telegram is prepared to recommend that General Hughes make speeches in the British trenches when the wind is favorable.

* * *

The millwright who depends on figures alone and never uses a speed indicator is very likely fooling himself as to some of the machine speeds. Strange things happen at times in power transmission, and the only way to keep exact track of them is by checking up the figures against speed indicators now and then. It is like a navigator proving up his dead reckoning by taking observations from the sun now and then; it corrects errors.

# Arithmetic for the Machinist and Workshop Operative

By J. H. Rodgers

*It will be found by those who have followed the previous lessons and profited by them that the various practical applications can now be easily observed, applied and appreciated.*

## LEVERS.—I.

THE lever is one of the simplest and yet most universally used of all the mechanical powers. This simple piece of mechanism is very often employed in parts of machinery, in such a disguised form as to be almost unrecognized by the average workman.

The simplest form of lever is a rigid bar, which turns about a point called the fulcrum. The two arms which compose the lever are called the power arm —taken from the fulcrum to the point where the force is applied—and the weight arm—taken from the fulcrum to the point of resistance. There are three classes of levers, according to the position of the fulcrum in relation to the power applied and the resistance.

(1)—Where the fulcrum is between the power and the weight.

(2)—Where the weight is in the middle.

(3)—Where the power is between the fulcrum and the weight.

In all levers the power multiplied by its distance from the fulcrum will equal the weight multiplied by its distance from the fulcrum.

Compound levers are two or more simple levers working in a train, where the long arm of one lever acts upon the short arm of the other. This can be more clearly understood by referring to chart 49, which gives the necessary formulae for the solution of same.

A shaft of iron is held between the centres of a lathe. To straighten this shaft, a bar 4 feet long is used. If three inches back, a heel or fulcrum is made upon the tool rest, and a man exerts a force of 180 lbs. upon the outer end of the bar; what pressure is exerted upon the shaft?

This is an application of a lever of the first order, and from the formulae given in chart 49, we have:—

$$W = \frac{PL}{l} = \frac{180 \times 45}{3} = 2{,}700 \text{ lbs.}$$

The application of a lever of the second order is similar to that of the first, but the lever of the third order is one that acts at a disadvantage when viewed from a power standpoint. It has, however, the advantage of raising the weight through a greater distance than the force applied.

A weight of 80 lbs. is placed at the extreme end of a 42 in. lever, what force is required 20 inches from the fulcrum to raise the weight, the fulcrum being at end of lever?

By formulae:— P:W=l:L, or

$$P = \frac{WL}{L} = \frac{80 \times 42}{20} = 168 \text{ lbs.},$$

where P = power applied; W = weight or resistance; l = weight arm, and L = power arm.

In the compound lever shown on chart 49, what weight will a force of 100 lbs. raise if the three power arms L, $L^1$, and $L^2$ are 20 in., 18 in., and 22 in., and the three weight arms l, $l^1$ and $l^2$ are 5 in., 4 in., and 8 in.?

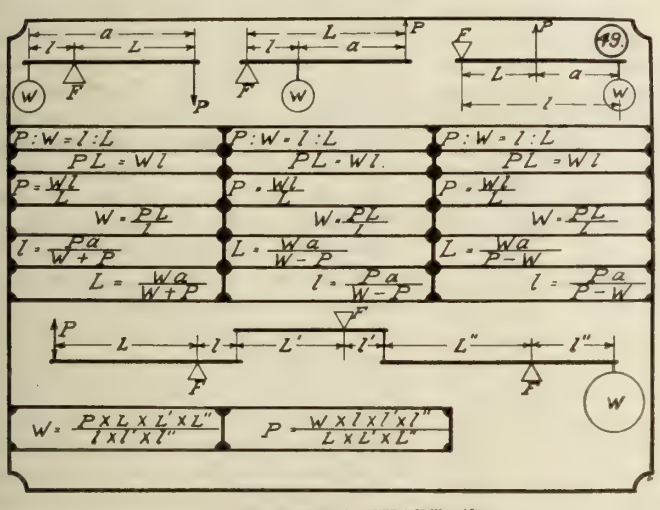
By formula:—

$$W = \frac{P \times L \times L'' \times L''}{l \times l' \times l''} = \frac{100 \times 20 \times 18 \times 22}{5 \times 4 \times 8}$$

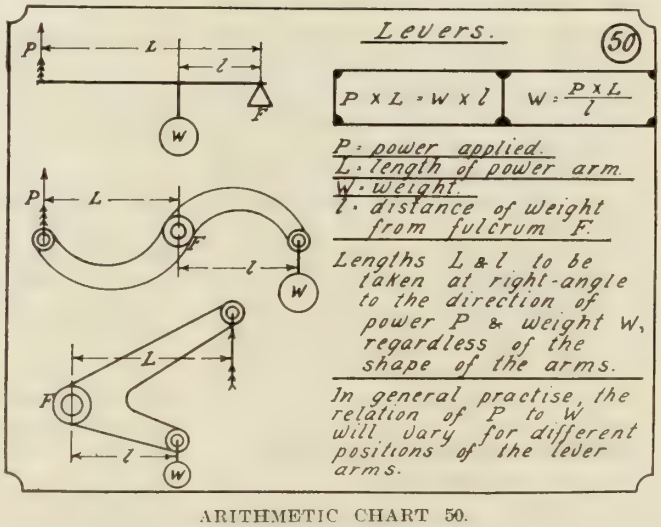
=9,900 lbs.

In general practice the lever will often require a shape that may appear to depart from the principle of the simple lever, but the shape is only a question of design, to add appearance, or to meet the requirements of local conditions, it being often necessary to meet certain needs and yet prevent interference with other parts of the same mechanism.

As is shown in chart 50, the length of the arms (for calculation) is always taken at right angles to the direction of the weight, or applied force. In practice the length of the arms of most simple levers will vary according to the different positions in which they are are placed.



ARITHMETIC CHART 49.



Levers.
50
P x L = W x l
W = P x L / l
P = power applied.
L = length of power arm.
W = weight.
l = distance of weight from fulcrum F.
Lengths L & l to be taken at right-angle to the direction of power P & weight W, regardless of the shape of the arms.
In general practise, the relation of P to W will vary for different positions of the lever arms.

ARITHMETIC CHART 50.

## NICKEL DEMAND TAXES CANADIAN OUTPUT.

THE unprecedented demand for nickel, largely for the manufacture of munitions of war for the allies, has necessitated a further increase in the output of the leading producers of the Copper Cliff, Ont., district.

The reverberatory furnace department of the Canadian Copper Co. was started up last week for the first time since last August. This will take care of all the fine ore from the mines not used in the blast furnaces, as well as the flue dust, and will smelt some 15,000 tons of ore a month. The ball mill and wedge furnace plant will also be put in operation to pulverize and roast the ore for the reverberatory.

Even with the present smelter going full blast the output will not be sufficient to meet the demand, and the construction of a new 25-foot blast furnace has already been begun. This is larger

than any blast furnace in the district, though it is surpassed in size by some of the furnaces in the West. It is planned to have the new furnace in operation by fall.

More ore is being mined at the Creighton mine than ever before, and preparations are being made for a considerably increased production. Already work has been begun on the sinking of the new inclined five-compartment shaft, and, in addition to this, a complete new hoisting and rock crushing equipment will be installed.

When complete, the new hoist will be surpassed by only one mine on the continent, namely, at North Butte. Many new houses are being built and many others transported on flat cars from the company's town at No. 3, Frood mine, which has been closed down since last August.

The demand for nickel has resulted in the International Nickel Company increasing the dividend on its common stock. A large number of the employees of the Canadian Copper Co. are holders of this stock, a certain number of shares being allotted to each employee yearly, under a plan similar to that in force at the U. S. Steel Co. and several other large plants.

The war has been the principal cause of the big demand for nickel, as the metal is used in cartridge cases as well as in armor plate, which averages 3 per cent. nickel. Nearly all the nickel is now sold in the metallic form, while before the war nearly half was sold as oxide.

Varying percentages of copper are also contained in all the ores, and the fact that this metal has been selling around 19c has increased considerably the profits of the companies operating.

## SHELL CONTRACTS OVER $154,000,000.

IN a recent interview, Brig.-Gen. Bertram, chairman of the Canadian Shell Committee, is quoted as stating that shell contracts for the Imperial Government so far awarded in Canada amount to over $154,000,000.

Four months ago (February), the committee commenced shipping the shells, the average shipment then per day being five hundred shells. The daily shipments are now stated to average ten thousand, and before the first of July these must be brought up to a daily average of forty thousand. This must be done in order to complete the order before its expiration date at the end of the year.

The number of plants working upon the contracts let out by the committee have been steadily increased, until at the present time every available machine shop, railroad shop and other plant capable of turning out shells or parts of shells is working to capacity.

"As an instance of the efficiency of the work," Gen. Bertram is quoted as saying, "the first contracts we placed for 200,000 shells were completed exactly one month ahead of time. That was an excellent piece of work." Four hundred and thirty thousand shells have, we understand, already been shipped from Canada.

## NATIONAL MACHINE TOOL BUILDERS' ASSOCIATION CONVENTION.

THE official programme of the thirteenth semi-annual convention of the National Machine Tool Builders' Association, to be held May 20 and 21, at the Marlborough-Blenheim Hotel, Atlantic City, has been issued as follows:—

**THURSDAY, MAY 20.**

**Morning Session.**

9.00 to 9.30 O'clock.

Registration of members.
Roll call.
Reading of minutes.
Report of membership committee, J. H. Drury, chairman.
Announcement of auditing, resolutions and press committees.
Call for resolutions.
Reports of officers and committees.

10.45 O'clock.

Address "The Application and Use of Time Study Data," Robert I. Kent, editor, Industrial Engineering, New York city.

12.00 O'clock.

Address "How to Profitably Operate a Night Force," Harold C. White, superintendent of assembling, Pierce-Arrow Motor Car Co., Buffalo.
Discussion.

**Afternoon Session.**

2.00 O'clock.

Lathe committee.

2.30 O'clock.

Sensitive drilling machine committee.
Boring machine committee.
Gear cutting machine committee.
Grinding machine committee.

4.00 O'clock.

Hand screw machine committee.
Planing machine committee.
Other committees on call.

**FRIDAY, MAY 21.**

**Morning Session.**

9.00 O'clock.

Multi-spindle drilling machine committee.
Milling machine committee.

10.00 O'clock.

Shaping machine committee.
Vertical drilling machine committee.

11.00 O'clock.

Turret lathe committee.
Radial drilling machine committee.
Other committees on call.

**Afternoon Session.**

2.00 O'clock.

Address "Drop Forgings," A. M. Tilton, president, Drop Forging Co. of New York, Jersey City, N.J.

3.00 O'clock.

Address—"Neutrality," George Grafton Wilson, professor of international law, Harvard University.
Executive session.
Adjournment.

## CHAIN DRIVE DEVELOPMENT

THE adoption of electric driving for every class of machinery has given rise to many special problems in power transmission. In the early days the usual practice was either to drive the whole existing shafting by means of a motor or to split up the shafting into sections, each motor-driven. Belt drives were employed in both cases. The economies and other advantages of group driving led naturally to the adoption of individual drive for machines which were not run continuously in unison with their neighbors. With this increase in subdivision the driving of each machine became a proposition by itself, to be solved by the selection of the most suitable type of motor, controller, and the transmitting connection between the motor and the machine. Only in rare cases is a direct drive from a high-speed motor permissible.

Relatively to other modes of transmission, the chain gear has made the greatest advance. It has made this advance in face of the conservatism which prefers to put up with the known disadvantages of belts and meshed gears rather than adopt a solution which involves a novelty even more problematical than the motor itself. Credit for such rapid progress is due to the high standard in design and manufacture achieved by the chain-makers. The problem of producing a chain which will run noiselessly, with a minimum of friction and wear, and without "stretching," is an unusually difficult one, but it has been satisfactorily solved. The solution provides an efficient positive drive which is extremely space-saving and extremely flexible as a speed reducer.

The chain drive, in fact, is a high-class job, and, like most high-class jobs, it is a saver of money in the long run. Our manufacturers are often accused of faults which they do not possess, but they often suffer from a tendency to prefer the cheap in first cost to the ultimately economical. This tendency ought to be resisted by consulting engineers and others to whom manufacturers turn for advice. When a mechanical improvement is analysed, one will generally find that it implies an increase in capital cost with a reduction in running costs, at least in relation to output. Machinery itself is of this character. The electrification of a factory is of this character, and such refinements as chain-driving and ball bearings justify their existence by the money they save day by day.—Engineering Review.

Just as it was with belts, so it is with motors—some men get better service, with less trouble than others. There is always something in knowing how to care for and use equipment.

## CARE OF BELTING IN MANUFACTURING PLANTS.

By P. W. Blair.

TO get the highest efficiency in power transmission is still a problem confronting the manufacturer of all kinds of product. Leather belting and gears are the best known power transmitting agents. Although during the last decade other transmission mediums have been placed on the market, leather belting still maintains a leading position. It has demonstrated its ability to stand more abuse and high speed and come out alive than any other means of power transmission.

### The Belt Man Feature.

It is an undisputed fact that if leather belting be given the proper attention, which of necessity must be given same to get the full amount of wear out of it, results will demonstrate beyond question its high degree efficiency and economy. To promote this efficiency and economy in an up-to-date plant no matter the size, one of the first conditions is that the entire care of the belting shall be entrusted to one man, that he shall be held solely and fully responsible for it and that no repairs or alterations of any sort may be made or dressing applied except by him or under his immediate direction.

Some may think this arrangement unnecessary, as their plant is not large enough. No manufacturing plant, however, is so small and none so large as to prejudice remunerative returns. It is a necessity because it makes some one man responsible, thereby insuring that attention is given when needed and not when it is too late for the stitch in time. It also insures as far as may be uniform treatment of the belting, a powerful factor in determining its efficiency and life. It makes possible the keeping of a record of repairs of the term of service of individual belts.

The man selected for the position should know of what the proper care of leather belts consist, of the making of laps, the taking up of belts and their repair. He should be provided with the necessary equipment for doing all ordinary belt work. It should be the duty of the belt man to make a careful and systematic inspection of all belting at definite and frequent intervals. Again, by keeping records of the different belts and their repairs, it gives you the cost per year of belt upkeep on each individual machine or pulley.

It is a fact that in the average shop very few belts wear out legitimately. They are ruined through accident or improper attention—usually the latter. A narrow belt properly maintained and the tension at the right point will transmit more power than a wide belt in poor condition and running as slack as they are usually allowed to run in the average shop. If the belt is too tight it means waste due to friction, if too loose it means loss due to slip. A few fundamentals on the care of belts are as follows:—

### Belt Care Fundamentals.

1—Do not run double belts on pulley less than 6 ins. diameter, or triple belts on pulleys less than 20 ins. diameter.

2—Pulleys should be 20 per cent. wider than the width of the belt.

3—Never let belt touch shifting devices or lap steps of cone pulleys.

4—Belts should run with hair-faced side to pulleys.

5—Outside points of splices should trail when running to avoid opening by the action of the air.

6—Belts should sag into pulleys and not away from them .

7—Run up-and-down belts on a slant.

8—Avoid very short drives.

9—Keep pulleys clean.

10—Clean belts at regular intervals and apply a dressing that will give the grain side a soft and adherent surface.

11—Remedy all faults in their early stage.

The tightness with which belts are put on the pulleys is of fundamental importance. If too tight there is a large, unnecessary loss of power from excessive friction at the bearings, to say nothing of the fact that the leather is overstrained and injured. On the other hand, if the belt be too loose, the belt is liable to flop around and jump from the pulleys, particularly when working where a load is suddenly thrown on or off. When the belts are put on and taken up under the direction of one man, the errors of too tight and too slack belting are avoided and a uniformity of belt tension exists throughout the factory or plant which can be obtained in no other way. Of course, it is evident that the slacker a belt can be run up to a certain point and do its work satisfactorily, the greater the economy.

In installing belting and taking it up, consideration must be given to the fact that certain kinds of belting are affected by weather conditions, lengthening and shortening, according to the moisture in the air. This is particularly true of certain makes of Chrome leather belting instances being known where babbitt has been melted out of boxes and shafting strained as a result of such belting being put on too tight.

There is more belting ruined by improperly lined shafting and pulleys than in any other way. The belts under this condition are either kept on the pulleys by guides or rub against hangers or portions of machines until a lap is started, thus catching the belt and tearing it open or stretching it excessively on one side. Belts so stretched will not run straight and are apt to run off the pulleys and become torn.

In all replacements as well as in the initial instalment, economy should not be the only thought. It is a very simple matter to connect two pulleys by a band in such a way that when one pulley is turned the other will go around. It is not, however, a simple matter properly to proportion a drive and select the size and quality of belting which will transmit power most efficiently and economically. Yet the problem seems so simple that it more frequently than not fails to receive the necessary consideration, and a common result is that belting is condemned when really the man should be condemned who asks the belt to work under the given conditions. Most belt troubles would never appear if the design and installation of the belt equipment were placed in competent hands.

It may be stated as a general rule that the use of the best quality belting of weight and pliability adapted to the work required will pay good dividends in lessened repairs, increased life of belting and increased output of machines. Sticky belt dressings are best avoided. Neat's foot oil will be found a good leather preserver. All new belts should have an application of same applied on both sides before being put in use or when the belts become dry. There are now a number of belt lacing machines on the market which are proving very satisfactory. They can be brought right to the point where the breakdown happens to be.

All belts should be inspected periodically so as to anticipate breakdowns and also to see that they are kept clean and pliable. Repairs should be made out of working hours.

## PRACTICAL NOTES ON ROPE TRANSMISSION.

By H. Womersley.

ROPE driving is divided into two systems, the British or multiple system, and the American or continuous system. Each system has its particular advantages and the user must study which is best for his particular purpose.

### British System.

The British system consists of one or more separate and independent endless ropes driving by the natural tension due to the weight of each rope, and the adhesion or wedge action due to the angle of the pulley grooves. No tension carriage being employed, the driving and driven sheaves should be located far enough apart to obtain the required tension. One advantage of this system is that in case one of the ropes breaks, the drive can be operated until replacement is made. The multiple system is not adaptable for vertical drives. When installed with due regard to suitable dimensions, are of contact, relative positions of pulleys, and number and size of ropes for the power to be transmitted, the result is practically positive, steady and noiseless, with immunity from breakdowns. By having a few spare grooves any further addition of power is immediately available.

If cotton ropes are used, it is essential that the pulleys should not be less in diameter than approximately thirty times the diameter of the ropes which are to run in same. For instance, if ropes 1 in. diameter are decided on, the least pulley should not be much below 30 ins. in diameter, and if 2 ins. diameter ropes are to be used, the least pulley diameter should be about 60 ins. If Manilla or hemp ropes are used, the smallest pulleys should be at least one third larger than for cotton ropes. I am aware that these dimensions cannot always be worked to, but it must be understood any radical departure will be at the sacrifice of both power and life of ropes.

The maximum direct driving centres are mainly determined by the diameters of the pulleys and the sag of the ropes; the working, and slack or trailing spans of which must be kept a safe distance apart. It will be readily seen that longer centres are possible when the taut is on the top side. With the bottom taut, the sag of the slack side may be estimated at about 10 per cent. of the pulley centres. When driving conditions and load are of a steady character, best results are obtained when the bottom is the taut side of the ropes, as the slack or trailing span of the ropes on the top side increases the arc of contact.

There are cases when it may be anvantageous to have the taut or working side on top, as, for example, saw mill drives, rolling plants, or power taken from oil and gas engines, where the shock is transferred to the driving ropes. The fact of the working strain being on the top side reduces the possibility of the ropes jumping the grooves, as the slack span in which the shock is principally absorbed falls away from the underside, and by its weight helps to neutralize the effect. The best results are obtained when the ropes are working in a horizontal position, or up to an angle of about 45 degrees.

Vertical drives are not recommended, but it is possible to get tolerably satisfactory results if the following is borne in mind:—Have the bottom pulley considerably larger in diameter than the top pulley; have a special groove angle of about 30 degrees, and at least a 25 per cent. increase in number of ropes compared with an ordinary drive. Exposed drives on the multiple system should be avoided, unless arrangements can be made for a liberal amount of sag during dry weather, and a larger factor of safety in the shafts to providing against stresses due to shortening of ropes in wet weather. Watering ropes to take up slack should never be resorted to.

### American System.

In the continuous or American system of rope drive, one long rope is wound around the driving and driven pulleys as many times as may be necessary to transmit the required power. The rope is then conducted from the last groove back to the first one, by means of an idler pulley held at the required angle, This idler is mounted on an adjustable carriage to which is attached a weight for taking up the slack of the rope, in order to secure the necessary friction. This system is adapted for vertical drives. The splicing of ropes is a most important matter and should be carried out by experts. For splicing purposes each rope will require to be of an extra length equal to 80 times its diameter.

Slipping of ropes is not due to slackness, but arises through either overloading, ropes being too small in diameter, or groove of unsuitable shape. New driving ropes are lubricated to provide a smooth coating and prevent friction between the twisted surfaces of the strands in contact with each other. A good lubricant is compounded from saponified tallow, wax, and plumbago. Greasy compounds likely to penetrate the fibre should be avoided, but if any have been so treated, a liberal supply of whitening should be used, as this absorbs the grease and falls away in flakes.

It is important when installing rope drives to encase the sides of the pulleys with sheet metal or boards, as otherwise the displacement of air by the arms of high-speed pulleys adds materially to the load. To secure the best results in regard to efficiency and durability, the working tension must be a small percentage of the ultimate strength of the rope. The following formula is a good guide to secure an economical rope drive:—

T=Safe working tension in lbs. per rope.

F=Centrifugal tension in lbs. per rope.

H.P.=Horse power transmitted per rope.

V=Velocity in feet per second of rope.

W=Weight of rope per ft.

D=Nominal diameter of rope in ins.

$$\text{Then, H.P.} = \frac{2\,V\,(T-F)}{3 \times 550}$$

$$T = 160\,D^2.$$

$$F = \frac{W\,V^2}{32}$$

As the above formula gives power per rope, the total power transmitted equals H.P.×N, in which N equals number of ropes in the drive.

## HEAT AND WORK EFFECTS ON METALS.

IN a paper recently read before the Institute of Metals, Prof. A. K. Huntington describes a machine for making alternating bending tests which he erected in 1902 with the object of studying the behaviour of firebox stays at various temperatures. This machine was capable of dealing with 1-in. bars. The results obtained in making a series of tests on copper and an alloy of copper are plotted as curves, which show well defined maxima and minima. These curves are also correlated with ordinary tensile curves.

Besides showing by mechanical tests that definite changes in physical condition takes place in metals with changes of temperature, Prof. Huntington has collected together the results of other experimenters in various directions with the object of making the suggestion that some at least of the maxima and minima are common to different metals. He urges that the study of the physical and mechanical properties of metals should be carried out in future on a broader basis than heretofore, taking into account more fully the effects of these changes of state with temperature both from practical and theoretical points of view.

An interesting and important point brought out in the curves is the way in which the maxima and minima representing changes in the mechanical behaviour of metals with changes in temperature is emphasized by the effects of cold work.

# Series of Practical Questions and Answers for Mechanics

*Every care is being taken to include only pertinent, practical questions, and give same direct reliable answers. Catch questions will be avoided. Arithmetic, consisting of simple addition, subtraction, multiplication and division will be found a useful companion study.*

## PROBLEMS RELATING TO MILLING MACHINES.

THE manufacturing milling machine owes much of its success to the fact that it can be used for the production of intricate interchangeable parts in large quantities with comparatively untrained operators. The use of this machine in the tool room, however, involves certain calculations that are rather difficult for the apprentice to understand if he does not receive painstaking explanation of them.

Most builders of milling machines furnish very complete instructions for operating their machines, and these should receive careful study by operators or intending operators. Charts also are usually furnished, but seldom last long in comparison to the life of the machine.

Probably the most useful instruction in connection with milling machines is contained in the old maxim originated by Brown & Sharpe: "Keep the cutters sharp." Care in operating is also necessary, particularly when starting cutters into the work. Few breakages of cutters are caused by the cutting strains of regular work, even when this is excessive, but a great amount of damage can be instantly done to the machine and fixtures by jamming a cutter. It has been found by experiment that cutters last longer and more metal is removed with less power when a fairly heavy cut and definite feed are employed.

* * *

**Question.**—What depth should the cutter be fed down into a 2 15-16-inch shaft in order to cut a ¾-inch keyway 3-16 inch deep?

**Answer.**—The usual method adopted by the mechanic is to feed the cutter into the shaft until a flat is produced exactly equal to the width of the cutter and then to sink the cutter the desired amount. This method can also be adopted to centralize the shaft with the cutter.

The height of the segment above the top of the keyway would be $r-\frac{1}{2}\sqrt{(4r^2-c^2)}$, where $r$ = the shaft radius and $c$ = the width of the flat. Height, then $= 1.46875 - \frac{1}{2}\sqrt{(4 \times 2.1571 - .5625)} = 1.46875 - \frac{1}{2}\sqrt{8.6284} = 1.46875 - 1.42005 = 0.0487$. Whole depth of cut is, therefore, $3\text{-}16 + 0.0487 = 0.1875 + 0.048.7 = 0.2362$ inch.

* * *

**Question.**—A six-inch milling cutter is to be used and the required cutting speed is 160 feet per minute. What should be the speed in r.p.m. of the milling machine spindle?

**Answer.**—Circumference of cutter $= 6 \times 3.1416 = 18.846$. Distance required to be covered per minute $= 160 \times 12$.

Number of revolutions $= \frac{160 \times 12}{18.846} =$ 101.87 r.p.m.

* * *

**Question.**—A number of rollers 12 inches in diameter are to be milled with 1-inch slots 1 inch deep. If the number of slots is 2,000 and the feed 3 inches per minute ,what would be the difference in the time required when using 4-inch cutters and 8-inch cutters, the table speed being the same in each case?

**Answer.**—The total depth of the slot = 1 inch plus the height of the arc. The height of the arc is, $r-\frac{1}{2}\sqrt{(4r^2-c^2)}$, where $r$ = radius of roller and $c$ = width of the flat. Height, therefore, is $6-\frac{1}{2}\sqrt{(4\times36-1)} = 6 - \frac{1}{2}\sqrt{143} = 0.021$. Total height is 1.021 inches.

Length of cut, allowing ⅛ inch for waste motion, is 8⅛ inches. The distance a 4-inch cutter must travel to come to its full depth of cut is $\sqrt{(2^2-.979^2)} = 1.744$ inches. Total travel for 2,000 cuts $= 2{,}000 \quad (8.125 + 1.744) = 19{,}738$ inches. Time required is $\frac{19{,}738}{3} = 6{,}579.3$ minutes, $= \frac{6{,}579.3}{60} = 109.65$ hours.

The distance the 8-inch cutter must travel to come to its full depth is $\sqrt{(4^2-2.979^2)} = 2.668$ inches.

Total travel of 8-inch cutter for 2,000 slots = total travel for 2,000 cuts = $2{,}000 \quad (8.125 + 2.668) = 21{,}586$ inches.

Time required $= \frac{21{,}586}{3} = 7195.33$ mins. $= 119.92$ hours. The time for indexing and running back will be approximately the same in both. The time saved by using the smaller cutter is, therefore, $119.92 - 109.65 = 10.27$ hours, or about 8.5 per cent.

* * *

**Question.**—It is required to mill a cutter with spiral flutes, the lead of which is to be 48 inches. The worm gear of the dividing head has 40 teeth and the pitch of the table feed screw is 4. Determine a suitable set of change gears for this purpose.

**Answer.**—The table advances ¼ inch with each turn of the screw. To advance 48 inches would require $\frac{48}{.25} = 192$ turns. The worm requires 40 turns to revolve the work through a single turn, and is driven from the table feed screw. The driver must make 192 turns, while the driven makes 40—that is, the ratio of the gearing is $\frac{192}{40}$, or 4.8. If simple gearing be used, all that is necessary is to place some suitable small gear on the feed screw and another on the worm 4.8 times as large, with idlers in-between such as will give the proper direction to the spiral. If a 20-toothed gear be placed on the feed screw, the gear for the worm will have $20 \times 4.8 = 96$ teeth. Also 25 and 120 or 30 and 144 could be used.

In many cases it is more convenient to use compound gearing, or, in other words, two pairs of gears. For this purpose the one fraction is made into two by simply factoring the numerator and denominator of the ratio and multiplying both by numbers that will give suitable gears. Thus, in the above case, the ratio is $\frac{20}{96}$. Factoring, we get $\frac{4\times5}{8\times12}$ or the two ratios, $\frac{4}{8}$ and $\frac{5}{12}$. Multiplying the first by 5, we get $\frac{20}{40}$, and multiplying the second by 8, we get $\frac{40}{96}$. It will be seen that this combination involves two 40-tooth gears which are not likely to be available. Multiplying by 6 instead, we get $\frac{30}{72}$, which is much better. The arrangement is now a 20-tooth gear on the feed screw meshing, with a 40-tooth gear on the stud, and a 30-tooth gear on the stud driving a 72-tooth gear on the worm of the dividing head.

* * *

**Question.**—A reamer is to be milled with 8 flutes. Plan a suitable indexing of this, so as to stagger the flutes, and thus prevent chattering of the reamer.

**Answer.**—This is a very simple operation, but certain considerations must be kept in mind. When flutes are stagger-

ed that is, milled at non-uniform spacing, it is necessary that there be an even number of flutes, and that each shall have another diametrically opposite to prevent warping in hardening.

If the flutes were spaced evenly, exactly five turns of the worm would be required for each spacing. If the circle of 20 holes be added to this, we get a total of $5 \times 20 = 100$ divisions for each flute, or 400 for the half circle. The quantity, 100, is to be varied, but the distance between two opposite flutes must always be 400 divisions. Choose a certain variation, say, 4 divisions or 1-25 of the distance between two flutes. It will be best to draw a circle and divide its circumference into 8 parts by means of 4 diameters.

Beginning at one diameter, mark the first space 100 divisions; the next, 4 less, or 96; the third, 4 more than this, or 100; and the fourth, 4 above the average, or 104. Throughout the four divisions of the other half of the circle, put down the same numbers as have already been placed in the divisions directly opposite—that is, 100 opposite 100, 96 opposite 96, and 104 opposite 104. It will be seen that the distance between any two opposite flutes is now exactly 400 divisions. Ninety-six divisions, of course, means 4 turns plus 16 holes, and 104 divisions means 5 turns plus 4 holes, etc.

* * *

**Question.**—It is desired to mill nine flutes equally spaced in the circumference of a reamer. The worm gear of the dividing head has forty teeth and a division plate containing circles of 24, 27, 33, 35 and 38 holes is available. What would be the setting of the dividing head?

**Answer.**—As there are forty teeth in the gear, forty turns of the worm are required to revolve the work through a complete revolution. For one-ninth of a revolution $\frac{40}{9} = 4\frac{4}{9}$ turns of the worm are required. It is evident that, to secure the four-ninths of a turn, a circle with a number of holes divisible by 9 is required, which naturally specifies the 27-hole circle. Four-ninths of 27 gives 12 as the number of hole divisions to give 4/9 of a turn. The number of turns, then, for each flute will be 4, and the sector will have to be set for 12 additional holes.

## BEING READY FOR WAR.

"THIS war has brought home to us the necessity of being ready for war," said Lieut.-Col. A. G. Hadcock, of Armstrong, Whitworth & Co., Ltd., at a meeting of the Royal Institution. Lieut.-Col. Hadcock said the manufacturing capacity of Great Britain had been strained to its utmost. We had had to make guns and ammunition in a few months over which other nations had taken the same number of years.

Referring to big guns, the speaker said few people were aware of the extensive knowledge of science and art necessary to construct a gun and mounting. In the construction of some guns, wire is wound round them, and, in a 12-in. calibre gun, the length of this wire was about 130 miles, and in a 13-in. calibre gun about 140 miles, while in some of the latest guns the length of wire exceeded 190 miles. Guns were found to become gradually longer after continual firing. The longer a gun was the quicker it would wear out. The life of a gun depended greatly upon the heat of the gunpowder.

## SUPPLY OF WAR MATERIAL.

ALEXANDER ADAMSON, a retired shipbuilder and engineer, who has been connected with the greatest armament, shipbuilding and engineering firms in Great Britain, writes to the Press that from absolute knowledge of all the conditions, he is certain that we could have had now sufficient munitions of all kinds had the great armament firms been told eight months ago clearly what they had to supply.

He remarks that no "superman" is necessary; the organizing ability is there already. He declares roundly that "all this fuss about drinking is simply a red herring drawn across the trail to hoodwink the public and direct attention from the culprits. There is always a considerable amount of drinking among certain classes of workmen, but not enough to turn the country upside down in times like these, or to affect the output to any great extent." This is more or less the general consensus of opinion among those properly informed, and it is clear from Mr. Adamson's statements that he is not writing with bias towards either men or employers.

## STEEL INGOT MOULDS.

INGOT moulds made of hematite iron, says Le Génie Civil, have not given satisfactory results, and are now in some works replaced by ingot moulds made of cast steel, which offer important advantages over the cast iron ones. It is true that they cannot be cooled down by water, and that a large area is required to allow them to cool down in the air, but this is the sole disadvantage attendant upon their use. In the manufacture of steel ingot moulds, the core consists of an inner cast iron centre surrounded by straw, on which is put the loam covering, 70 mm. ($2\frac{3}{4}$ in.) thick; this thickness is made up of successive layers, the core being dried in the stove after each layer. When completed, the cores are placed in cast iron boxes lined inside with firebrick and a layer 20 mm. ($\frac{3}{4}$ in.) thick of loam. Cast steel ingot moulds have an average life of 380 castings.

**Wiping a Joint.—Open the end of one piece of pipe so that the other piece of the pipe will just enter, then scrape with a shave-hook to size of joint, taking care to keep it perfectly clean. Fasten the two pieces of pipe securely in position, rub bright parts with a tallow candle, and proceed to pour or splash metal on joint, wiping it into shape with a cloth made of several thicknesses of fustian. You will require a metal pot, ladle, bar of metal, shave-hook, turnpin, soil, tallow, rasp, several cloths, and a deal of patience.**

## THE CANADIAN SHELL MANUFACTURING SITUATION.

IT is daily becoming increasingly evident that what we were prompted five months ago to dub as "Canada's Impromptu Industry," to wit, the manufacture of shrapnel and high-explosive shells, appears to be still in its infancy, and both through the aptitude with which it has been gripped and the exigencies of the mliitary situation, there is every prospect of its attaining to the full stature of manhood with respect to development and achievement.

The proposal, determination and necessity to have shells manufactured in Canada was, in the closing months of 1914 conceived and nurtured in an atmosphere of zealously and jealously guarded secrecy, and even up until a month ago, no disposition to remove the veil was apparent, or seemed even to have been considered. Throughout the period named a few of our more prominent manufacturers were groping their way with the assistance of such knowledge of methods, devices and equipment details as may have been their good portion to secure, and that their efforts and labors have not been in vain is now amply borne out, thanks, more than anything, to their native intuition and mechanical genius.

Necessity knows no law, and, after all, has little respect for secrecy, even of the official type. Ottawa, as in many other directions in recent times, failed to realize as it should that this shell manufacturing business was the "Nation's Business," and, in the attempt to hush and lull the Canadian public and Canadian industrial enterprise into unconcern relative to shell production, she unwittingly we hope indeliberately—created a situation as regards our engineering and metal working plants that time even may not now provide the needful compensation.

The demand for ammunition ad. lib. was public knowledge long before public participation in providing it was deemed necessary. Whether the placing of contracts through our Shell Committee or extending the scope and freedom of that body in its work was too unspectacular as compared with raising volunteer contingents for overseas service, or whether due to a desire on the part of Ottawa officialdom to appropriate and concentrate credit in a limited personality, the fact remains that to-day our engineering workshops and metal working factories are not equipped as they should and would otherwise have been to handle this shell manufacturing business as becomes our captains of industry, their staffs and employees.

However much or however little has already been done to develop shell production in our Dominion, it is quite apparent that a great deal more is required, even neglecting the leeway which should but never may be made up. The meantime greatest trouble connected with Canada's shell industry belongs to the supply of shell forgings, it being a matter of more or less common knowledge that while the capacity of our machine shops is the equivalent of some forty thousand finished 18-pounder shrapnel shells per day, our forging plants in existence are able to meet this rather over half-way only, or to the extent of 23,000 forgings per day.

One things appears certain, our manufacturers have not been assured as they might have been of the prodigality of shell orders available, else more of them would have gripped this shell business at the billet instead of at the forging end. In addition, with reference to the machining processes only, there has been much hesitancy displayed towards rearranging or installing new equipment and attachments.

The engineering and metal working industries of Great Britain and France have been so organized and developed during the past nine months that the output of munitions of war for March of this year as compared wih last September has increased twenty and thirty times respectively, and is still rising. It is pertinent to ask at this stage of the game if all of our manufacturing concerns who are not now producing shells but who want to bear a part in the work, have been made fully cognisant of the prodigality of the situation and been encouraged if not bidden to jump in?

# The General Market Conditions and Tendencies

**This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.**

**Montreal, Que., May 17, 1915**—General market conditions throughout the province are in perhaps a little more encouraging condition than they have been for some time past. This is due more or less directly to the making of various lines of war supplies, principally ammunition. The distribution of several orders for lyddite shells, of a heavier variety than that generally manufactured here, has lent not a little encouragement to steel manufacturers. Machine tool men are also very busy filling orders accepted earlier in the year. The foundry trade is still very quiet and pig iron markets are in consequence very dull. Metals are exceedingly active and more so as the demands for munitions of war are continually increasing. It would thus appear that business is improving, and, taken together with the fact that water communication with this port is fully established for the season, the outlook is much better than has been the case of late.

#### Steel Trade.

The tremendous and unforeseen demand for shells in Canada has been the medium through which many steel companies have been able to increase their business. The 4.5 inch lyddite shell is quite a weight in itself and when thousands of these shells are being manufactured it runs into a big tonnage. Then again, base plates, steel discs, etc., are all consuming large quantities of steel.

Another feature that has been attracting the attention of the sales departments of the various steel corporations is the present opportunity to develop foreign trade. The Algoma Steel Corporation have succeeded in placing a considerable tonnage in the United States and some in the South African colonies. It appears that the German foreign trade in steel ran up to over 20,000,000 tons annually. This supply has, of course, been cut off indefinitely. The demand has naturally shrunk materially but there still remains a large proportion to be looked after. To Canada and the United States will fall the duty of supplying this demand.

At present the high ocean freight rates absolutely prohibit the export of steel. In Australia to-day large tonnage could be sold if there was a reasonable freight rate prevailing. It remains, however, to be seen just what means will be taken to place Canadian steel in foreign countries. The demand is there, and Canadian steel is known to be of the best quality.

Tool steel is in good demand but building sections are rather inclined to be quiet.

### Pig Iron.

Pig iron is strangely dull. No trade at all is reported. Foundries are generally working on short time or are closed down. The result is that business is very poor indeed, and no price changes are reported. There is practically no foreign trade at all moving.

### Machine Tools.

The rather unprecedented situation in machine tools still exists. Very few changes occur from week to week, the output of most factories being booked for months. However, a most lively business is being developed in rebuilt tools for immediate and early delivery. Attachments for use in tooling up standard machines are also commanding much attention. Banding presses, nosing presses, and furnaces are in great demand, and many firms are building these in their shops to sell. These machines have been designed, developed and tested for use, in the shops which build them, and many excellent designs are available; some being pneumatic and some hydraulic presses. Keen competition in the sale of these machines is evidenced by the various agents representing the manufacturers.

The supply business is excellent also. Shops are now running full time, and some of them to the extent of twenty-four hours a day. This creates a healthy demand for supplies. Hydraulic presses for making forgings have been installed in many plants recently, thus the forging capacity of Canadian companies is rapidly increasing and will soon be up to the machining capacity which to-day is greatly in excess of the other. As the forging capacity increases the supply business will benefit.

### Metals.

The lively demand for metals for use in the manufacture of war munitions still continues. Copper prices are a little stronger and the tendency is to increase the prices still more. Tin is a little easier and has dropped in price a little. Spelter is in good demand and the price has gone up some. Lead prices are firm but unaltered. Antimony is selling well. The supply available is not great but seems to be sufficient for immediate needs. The demand, though, is largely in excess of that which was anticipated. Aluminum is very quiet. War demands have made business in all metals exceptionally good, the improvement has been especially noticeable of late.

---

**Toronto, Ont., May 18, 1915.**—Industrial conditions on the whole are showing some improvement, although the increased activity is principally accounted for by the war orders. Makers of leathers goods are very busy a large order for boots having been distributed among factories in Ontario by the Government. Further orders are also expected to be placed for boots by the Russian Government. Crop conditions continue favorable and there is an optimistic spirit in business circles on this account. A good crop will have a beneficial effect on trade, in addition, the money coming into the country on account of war orders will considerably improve conditions generally. The loss of the Lusitania has had the effect of increasing marine insurance rates and ocean freights are very high due to the shortage of tonnage.

### Steel Market

Conditions in the steel trade are much the same as last week. The demand for shell forgings is on the increase and steps are being take to cope with the situation by the installation of more forging presses. There is also an increasing demand for round steel bars for high explosive shells. Generally speaking the mills are working to capacity on steel for shells but quiet as regards ordinary business with the exception of the Algoma Steel Co. where the rail mill is in active operation. It is announced that the Dominion Steel Corporation has recently received a large order for shell forgings.

The building trade is not showing any substantial improvement and there is little inquiry for structural shapes. There has been a somewhat better demand lately for cast iron and steel pipe for water works extensions but the total tonnage will probably not be as heavy as last year. Prices on bars, plates and shapes are firm but unchanged.

An advance in prices of wrought iron pipe is announced due to increase in cost of raw materials. The recent advance in the States has also strengthened the market. The new discounts are 1 per cent. lower for block pipe ranging from 2 to 3 per cent. lower for galvanized pipe. Complete basing discounts are given in the selected market quotations.

Conditions in steel trade in the States are improving, an important factor being the large orders for steel products for foreign account, including munitions.

### Pig Iron

The trade is very dull and indications point to a continuance of the present conditions for some time to come. Until the industrial situation improves along more normal lines there will not be much demand for pig iron.

### Machine Tools

The difficulty of obtaining satisfactory deliveries of tools for making shells continues to cause great inconvenience to dealers and also to concerns contemplating going into the shell business. The situation has caused an unusual demand for second-hand tools and all suitable machines are being snapped up. The number of firms making shells is increasing and the demand for machine tools and tooling fixtures is therefore keeping up. More orders for high explosive shells will be distributed in the near future, and this which will create a further demand for lathes and drills. Ordinary business is still dull, dealers concentrating their energies almost entirely on enquiries for shell machinery.

### Supplies

The supply business continues brisk and prices are holding firm. The only price change to note is in linseed oil which has advanced 2c and is now quoted at 82c for raw oil.

### Scrap Metals

The market is active for copper and brass scrap, and quotations are very firm. Scrap iron and steel are dull and market quiet. Quotations are unchanged.

### Metals

The general situation in the metal markets is practically the same as last week. Copper, antimony and spelter are strong, but tin is weak, and lead unchanged. Locally there is a good demand for copper, lead and antimony for munitions, but ordinary business is quiet. Spelter continues very scarce and quotations nominal.

**Tin.**—The tin market is dull and easy, and the spot market is weaker on account of further supplies being available. Spot demand is dull. The market

has declined 3c and tin is quoted locally at 42c per pound.

**Copper,**—The market is quiet but strong and quotations unchanged. The New York Market is unsettled pending a reply to the American Government's note to Germany. Export inquiry continues good with fair domestic inquirey. Lake Copper is quoted locally at 21c per pound.

**Spelter,**—The market is very strong for both prompt and future deliveries. There is at present the greatest scarcity of spelter that has ever been experienced, and it is reflected not only in the advance of prices of prompt spelter but also in the continued rise of futures. Spelter has advanced 1c and quotations are normal at 17c per pound.

**Antimony,**—The market is dull but strong. The demand for antimony for munitions continues exceedingly large and higher prices are likely on account of the scarcity of this metal. Quotations are firm but normal at 40c per pound.

**Lead,**—The market is quiet but firm. There is a heavy demand for lead but the producers are able to meet it. The production of lead this year is believed to be greater than in 1914 when all records were broken. Quotations are unchanged at 5¾c per pound.

**Aluminium,**—The consuming demand is good, and market firm. Quotations are unchanged at 23½c per pound.

## WAR REVENUE DATA.

THE operation of the new war taxes is proving most satisfactory. The declines in revenue which were so marked a few months ago have been completely arrested while the present receipts are substantially on a parity or in excess of the corresponding period of last year.

In September, 1914, the loss of revenue was over $5,000,000, in October $3,500,000, in November $4,000,000, in December nearly $4,000,000, in January nearly $2,000,000. In the six months from the outbreak of the war to the end of January the total loss in the revenue over the corresponding period of the previous year was $18,669,317.81.

### Dominion Revenue.

The war budget came into effect on Feb. 12, since which date the revenues of the Dominion, although in the war period, have maintained a parity with those of the ante bellum months of the preceding year. For the months of February, March, April and the first ten days of May, the revenue of the Dominion has been $37,058,611.22, as compared with $37,332,310.92 for the corresponding period of the previous year.

The revenue for the fiscal year which ended on March 31 last, was estimated by the Minister of Finance upon the basis of the then existing tariff at $130,000,000. By reason of the increase in duties upon importations between the date of the budget speech and the end of the fiscal year the revenue will be found to be more than a million dollars in excess of the estimate.

# Canadian Commercial Intelligence Service

**The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.**

## CANADIAN TRADE COMMISSIONERS.

W. L. Griffith, Secretary, 17 Victoria Street, London, S.W., England.

# INDUSTRIAL AND CONSTRUCTION NEWS

**Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.**

## Engineering

**Calgary, Alta.**—The Ford Motor Co., of Ford, Ont., may build an assembling plant here.

**Cobalt, Ont.**—Fire damaged the Cobalt foundry on May 7, to the extent of $1,500.

**Paris, Ont.**—The G. W. McFarlane Engineering Co. has secured an order for shrapnel shells.

**Niagara-on-the-Lake, Ont.** — A mechanical filtration plant will be installed at the military camp here.

**Port Arthur, Ont.**—The Western Dry-dock and Shipbuilding Co. may manufacture farm tractors.

**Sherbrooke, Que.**—McKinnon, Holmes & Co. are making an extension to their plant which will be used as a machine shop.

**Montreal, Que.**—It is reported that the Canadian Car & Foundry Co. have received an order for two thousand steel cars from the Russian Government.

**Kingston, Ont.**—The Canadian Locomotive Co. will build an extension to their plant, 233 ft. long by 67 ft. wide. The building will be equipped with machinery for making shells.

**St. Marys, Ont.**—The by-law has been put through instructing the Clerk to issue debentures for $12,550 to provide for a new street lighting system, new gasoline, plant, etc.

**Toronto, Ont.**—The Local Hydro-Electric Commissioners received reports that there had been 3,000 horse-power added to the business of the system since the beginning of the year.

**Hamilton, Ont.**—A large ammunition factory is to be erected locally in the immediate future, according to an announcement made at the City Hall a few days ago. Further particulars are not yet available for publication.

**Hamilton, Ont.**—The Canadian Cartridge Co. has reached an arrangement with the city for the purchase of a site covering about two acres. The price paid is about $4,500 an acre. The company, it is understood, have another large order for shells. A building, costing $30,000, and 100 feet wide by 300 feet long, will be erected. There will also be a boiler room and machine shop. Christman & Co. have the contract.

**Toronto, Ont.**—The James Morrison Brass Manufacturing Co. have asked the property committee for permission to erect a cartridge factory 80 x 300 feet, two storeys in height, at 92 Paton road. This will be an extension to the present factory and is necessary so that they may manufacture a large quantity of M. M. rifle cartridges.

## General Industrial

**McLeod, Alta.** — The McLeod Flour Mills Co. will build a mill here.

**Ridgetown, Ont.** — The Ridgetown Flour Mills, which were recently destroyed by fire, will be rebuilt.

**Three Rivers, Que.**—A company has been organized here to establish a brick plant.

**Port Arthur, Ont.**—Mr. Cunningham, manager of the National Elevator, which was recently completely destroyed by fire, has stated that the elevator would be rebuilt as soon as the insurance is adjusted.

**Vancouver, B.C.**—H. F. Beers, of San Francisco, Cal., general manager of construction for the Sheel Company, an oil-refining concern, stated recently that he was here to look over the site for an oil refinery which the company will build in this vicinity.

**Walkerville, Ont.**—The Williamson Construction Co., of Walkerville, has broken ground for a new plant to be constructed for Hartwell Brothers Co., in Walkerville. The concern will manufacture implement handles, such as axe and hammer handles, etc., and is a branch of the same concern which is located in Chicago. The building will be 60 x 90 feet and one storey high.

## Trade Gossip

**Regina, Sask.**—The Provincial Legislature has under consideration a new Companies Act to supersede the two Acts now in force.

**The Canadian Ice Machine Co.**, Toronto, have sold a 40-ton vertical "York" steam-driven ammonia compressor to the Cowan Co., Toronto.

**The Canadian Ice Machine Co.**, Toronto, Ont., are installing a 50-ton "York" horizontal, steam-driven ammonia compressor at the Procter & Gamble Co. new soap factory at Hamilton, Ont.

**Toronto, Ont.**—The Canadian Kodak Co. have awarded a contract to the Canadian Ice Machine Co., Toronto, for a 200-ton vertical "York" ammonia compressor, direct-connected to a vertical, cross-compound steam engine.

**The Hamilton Lock-nut & Specialty Mfg. Co.** has recently been incorporated at Toronto with a capital of $500,000 to manufacture lock-nuts, screws, bolts, etc., at Hamilton, Ont. Incorporators: Melvin J. Dunham and A. N. Wells of Middletown, N. Y., also William Gibb and William Butler of Hamilton, Ont.

**E. L. Crabtree**, manager of the Dominion Machinery Co., Toronto, who is associated with two prominent Toronto engineers, contemplates establishing a plant at Oshawa, Ont., for making shells and automobile parts. The new concern will be known as the Dominion Metal Products Co.

**The Canadian Boomer & Boschert Press Co.**, Montreal, Que., has recently booked an order from the Canadian Vickers' Company, of that city, for six 350-ton hydraulic presses for forging 4.5 shells. Orders have recently been completed by the same company for the following:—Three 200-ton hydraulic piercing presses for shrapnel shells; three 150-ton hydraulic drawing presses for shrapnel shells; four 150-ton hydraulic disc presses; two 60-ton hydraulic pointing presses.

**The Hamilton Lock-Nut & Specialty Co.**, which was recently incorporated, expects to start operations early in June in a building which has been rented at Hamilton, Ont. The following directors have been appointed:—M. J. Dunham, A. N. Wells, W. J. Sutterby, W. H. C. Stroud, J. T. Stroud, O. W. Gibb, Wm. Butler, J. E. Davies, J. W. Anderson. The officers elected were as follows:—M. J. Dunham, president; J. T. Stroud, vice-president and secretary-treasurer; C. V. Langs, attorney for the company.

**Big Shell Contract.**—C. S. Martin, general superintendent of the Dominion Steel Corporation, on Saturday last received telegraphic notice to the effect that the Shell Committee at Montreal had awarded them a contract for the manufacture at Sydney of 1,500,000 shell forgings. This is in addition to a

600,000 shell order received some time ago, part of which has already been delivered.

**The Canadian Allis-Chalmers, Ltd.**, Toronto have been awarded the contract for pumps for the Gage Ave. sewage disposal plant by the Hamilton Board of Control.

**The Canada Wire & Cable Co.**, and Maloney Electric Co. of Canada, Ltd., have removed from 401 Lake of the Woods Building, to 501 Merchants Bank Building, Montreal Que.

**Dominion Steel April Output.**—The Dominion Steel Corporation reports its output for April as follows:

| | April, 1915. tons. | Previous year. tons. |
|---|---|---|
| Pig iron ..... | 23,130 | 20,861 |
| Steel ingots ..... | 25,343 | 26,397 |
| Rails . . . . . | 1,633 | 13,712 |
| Rods .. ..... | 6,512 | 3,021 |
| Bars . . . . . | 924 | 2,203 |
| Wire & wire prod'ts | 3,254 | 2,380 |
| Coal output ..... | 357,335 | 410,382 |

**Berlin, Ont.**—Shoe manufacturers of Berlin, Waterloo, Guelph, Brampton, Tilsonburg, Hamilton, Galt and other Ontario towns met here on May 4, for the purpose of making arrangements to handle a large order of shoes for the British army. It is understood that, providing it is guaranteed that the boots will be turned out according to specifications, 2,000,000 pairs will be manufactured at an estimated cost of $8,000,000. This will mean that all the shoe industries in western Ontario will be expected to turn out 10,000 pairs of shoes a day for a period of seven months.

**New Pulp Wood Process.**—What promises to revolutionize the pulp wood industry and have an important bearing on the paper trade is disclosed by H. J. Lyons, vice-president of the Canada & Gulf Terminal Railway, which is controlled by M. J. O'Brien. It is claimed that a new process, worked out in McGill University laboratories at Montreal, and which is to be freely available to any pulp wood producer, will result in reducing the weight of a cord of wood to about 2,200 pounds, thus making pulp wood available, which was previously unremunerative because of remoteness from paper mills and consequent high freight rates. The wood will be prepared in chipped form and dried and baled. A saving in weight of about 2,300 pounds, or nearly 50 per cent., is claimed.

**Manitoba Branch C.M.A.**—W. R. Ingram was elected chairman of the Manitoba branch of the Canadian Manufacturers' Association at its annual meeting on May 13. For vice-chairman, D. J. Dyson was elected, and W. J. Bulman was nominated as Manitoba vice-president of the Association, the nomination to be acted upon at the annual convention of the Association in Toronto, which begins June 8. The following executive council was chosen: W. S. Fallis, W. A. Matheson, T. R. Deacon, D. E. Sprague and L. A. Race, Brandon. The new executive committee consists of L. C. McIntyre, D. E. Sprague, T. R. Deacon, W. S. Fallis, H. W. Billing, John Brockest, G. F. Campbell, Jas. M. Carruthers, M. F. Christie, E. A. Mott, W. L. Helliwell, W. T. Kennedy, Thos. Boyd, F. J. Baker and N. W. Warren.

# Municipal

**Cartierville, Que.**,—The Council contemplate installing a filtration plant.

**ALLIES PURCHASING AGENTS.**

**The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:—**

**British.—Lieut. Johnston and A. C. Billing, Ritz Carlton Hotel, Montreal.**

**French—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendance Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.**

**Russian — Messrs. S. Ruperti and Aiekieff, care Military Attache, Russian Embassy, Washington, D.C.**

**Unionville, Ont.**—The purchase of a gasoline fire-engine is under consideration by the council.

**Port Colborne, Ont.**—The good roads by-law was carried on May 17, the voting being 166 for, and 33 against.

**Toronto, Ont.**—The Board of Control has decided to advertise for tenders for four cars for the Lansdowne avenue car line.

**Chatham, Ont.**—The municipal lighting and power plant may be sold when the hydro system has been completely installed.

**Vancouver, B.C.**—Mayor Taylor announces that he will cause to be brought down to the council money by-laws for creating additional works, and he is confident the taxpayers will vote in favor of them. They will amount to $700,000 or $750,000.

**Kamsack, Sask.**—An expenditure of $35,000 on water mains and sewers is contemplated. A by-law will be voted on in the near future.

**Hamilton, Ont.**—The Board of Control has under consideration a proposal from a company to establish a factory here. No details are available at present.

**Hull, Que.**—Extensions to the waterworks system to cost $200,000 are contemplated. An eight million gallon turbine pump and motor will be installed.

**Chatham, Ont.**—The construction of a system of intercepting sewers and two disposal plants is proposed for Chatham by plans prepared by City Engineer Adams. The estimated cost of the work is $120,473, which includes the cost of the pumping station but not the disposal plants. The council will in all probability deal with the scheme this year.

**Mimico, Ont.**—A method of supplying Mimico with water was practically agreed upon at a special meeting of the Village Council on May 17, when plans and rates were submitted by the New Toronto Council. The proposal is to purchase the water from New Toronto, to construct the mains under the local improvement system and to install a meter in each consumer's residence. It is estimated that the village will ultimately require about 50,000 gallons per day.

# Tenders

**Peterborough, Ont.**—Tenders for the supply and installation of a complete pumping unit will be received until May 31. Plans and specifications may be obtained from S. R. Armstrong, secretary of the Peterborough Utilities Commission.

**Toronto, Ont.**—Tenders will be received up to Tuesday, May 25, 1915, for a five million gallon pump, driven by 3-phase induction motor, for the Riverdale pumping station. Tenders must be addressed to the Chairman, Board of Control, City Hall, Toronto.

**London, Ont.**—Tenders will be received up to June 2 for a modern combination chemical and hose car, equipped with one 40-gallon tank, and having capacity for carrying 1,200 feet of 2½-inch hose. Full information will be furnished by Fire Chief John Aitken.

**Ottawa, Ont.**—Tenders will be received up to July 1, 1915, for the manufacture, supply and erection of a 30-ton steam wharf crane, of the derricking jib type, for Halifax, N.S., dockyard. The specifications and conditions of contract may be seen at the office of the consulting naval engineer, Ottawa.

**Winnipeg, Man.**—Tenders addressed to the Chairman, Board of Control, will be received up to Saturday, June 5, 1915, for the manufacture, delivery and erection in the generating station at Point du Bois of one 150 k.w. motor-generator exciter set. Instructions to bidders, specifications and form of tender may be obtained at the office of the City Light and Power Department, 54 King street, Winnipeg.

**Wallaceburgh, Ont.**—Tenders will be received by the town clerk until Tuesday, June 1, 1915, for the following works: Contract "A-1"—laying water mains; "A-2"—laying sewers; "O"—Laying sewer force mains; "P"—constructing sewage pumping stations; "T"—constructing electric transmission line. Plans and specifications may be seen at the office of Chipman & Power, engineers, Mail Building, Toronto, or at the resident engineer's office, Wallaceburg.

## Personal

**Walter Moberly**, railway engineer, died at Vancouver, B.C., on May 14, at the age of 83 years.

**Joseph Rielle**, civil engineer, died at Montreal on May 9, aged 81 years. Mr. Rielle was born at LaPrairie, Que.

**George Elliott Minorgan**, son of George Minorgan, proprietor of the Phoenix Foundry at Beaverton, Ont., was killed in action at Langemarck.

**Lieut. Eric B. Schrieber** of the 2nd Artillery Brigade, and until recently representative of Mussens, Ltd., at Quebec city, has died of wounds received in action.

**W. J. Brick**, formerly of the Campbell & Brick Heating Co., Winnipeg, has taken over the management of the Canadian Motor Co., succeeding A. T. Lane, who previously held the post.

**Claude A. Bulkeley** has been appointed chief consulting engineer with the Canadian Domestic Engineering Co., Montreal. Until recently Mr. Bulkeley was a consulting mechanical and electrical engineer in New York.

**Charles Rogers**, head of the firm of Charles Rogers & Sons, furniture manufacturers, died suddenly of heart failure on May 9, at his home, 25 Lonsdale road, Toronto. Born in Glasgow, Scotland, 71 years ago, deceased had resided in Toronto for the past 65 years.

**Thomas Hilliard** of St. Catharines, Ont., has been appointed secretary of the Purchasing Commission of which Hon. A. E. Kemp is chairman. He is an electrical engineer and has been sales manager for the Canadian General Electric Co., and later for the Crocker-Wheeler Electric Co.

**Lieut. J. B. Neale** of the Royal Grenadiers, who went to the front with the first Canadian expeditionary force, has arrived in Toronto, having been invalided home and on leave of absence. At the time he volunteered for the front he was manager of the Electrical Products Co. of Canada, Toronto.

## Marine

**Steam Barge Order.**—In a welter of war orders large contracts based upon a peaceful expansion in domestic commerce are, unfortunately, rare enough to claim distinction at the moment. The Collingwood Shipbuilding Co., Collingwood, has received an order for a steam barge from the Imperial Oil Co. of Sarnia, and the announcement will be received with unusual satisfaction in Collingwood, especially as there is said to be a promise of a second contract later on. The Imperial Oil Co. has hitherto had its boats built on the Clyde, but in view of conditions existing there, it was decided to give local industries the preference. The barge will cost $200,000, and delivery will be made in March next. The boat will be used largely on the St. Lawrence route, and if a second craft is ordered it will be placed upon the Pacific Coast.

## New Incorporations

**The Western Canada Power Co.** has increased its capital from $5,000,000 to $10,000,000.

**The Kawneer Manufacturing Co.** have increased their capital stock from $100,000 to $200,000.

**Fraser, Brace & Co.** have had their charter extended to permit of water and electrical power development.

**The Federal Rubber Co.** has been granted an Ontario Provincial license to carry on business in that province, with a capital not exceeding $10,000.

**The Dominion Road Machinery Co.** has been incorporated, with a capital of $300,000, to manufacture road and agricultural machinery at Goderich, Ont.

**The Columbia Handle & Lumber Co.**, of London, Ont., has been reorganized with a capital of $100,000, and will continue to make the same products as previously.

**The Lion Polish Co.** has been incorporated at Toronto, with a capital of $40,000, to manufacture shoe polishes. Head office at Toronto. Incorporators—Oscar H. King and M. P. Van der Voort.

**The Manitoba Universal Farm Tractor Co., Ltd.**, has been incorporated at Ottawa, with a capital of $50,000, to make tractors and engines, etc., at Winnipeg, Man. Incorporators—William Bryden, Herbert Irwin Call and Charles McPherson, all of Winnipeg.

## Wood-Working

**Victoria, B. C.**—The Weeks-Dunell Cedar Co. propose building a shingle mill and wharf on Baynes Sound.

**Rodney, Ont.**—The Rodney Woodenware Co. plant was destroyed by fire on May 10. The loss is estimated at $6,000.

**Three Rivers, Que**—The Gres Falls Co. saw mill was destroyed by fire on May 14. The loss is estimated at about $100,000.

**Mount Brydges, Ont**—The Wallace Sawmill Co. will probably rebuild their plant, which was destroyed by fire recently.

**Three Rivers, Que.**—The saw mill of the Gres Falls Co. was practically destroyed by fire on May 14. The mill was in readiness for the season's sawing, and its destruction at this time of the year will be a severe loss to the company.

## Catalogues

**Kerr Turbine Co.**, Wellsville, N. Y., has just issued bulletin No. 52 describing and illustrating "Economy" steam-turbine-driven pumps for water supply, boiler feeding, fire service, circulating condenser water, circulating water in heating systems, draining mines, etc.

**Furnaces.**—The Monarch Engineering & Manufacturing Co., Baltimore, Md., are distributing a bulletin devoted to melting and refining furnaces for treating various metals. The different types of furnace are illustrated and accompanied by a brief description covering the principal features of each with sizes and capacities. Other equipment described includes core ovens, blowers and fuel burners.

**Speed Counter.**—The Canadian Hart Wheels Co., Hamilton, Ont., are distributing a bulletin dealing with the "Veeder" straight reading speed counter. Two types are described and illustrated, viz., clutch speed and direct speed counter.

**The Holyoke Machine Co.**, Worcester, Mass., are distributing a leaflet giving particulars of the Lombard friction clutch. The chief item of interest is a table giving the principal dimensions and

a half cross-section to use in conjunction with the table.

**Feed Water Regulators** made by the Chaplin-Fulton Mfg. Co., Pittsburgh, Pa. This catalogue describes the "Vigilant" feed water regulator and the steam specialties, including reducing valves, and pump and tank governors. The general principles covering the automatic regulation of the water supply to steam boilers are dealt with in the opening pages, followed by a complete description of the "Vigilant" feed water regulator and its operation. The construction of this regulator and its application are shown by means of a number of illustrations. The same treatment is accorded the other specialties. Copies may be obtained from the Canadian representatives, The P. E. Cleaton Co., Montreal, Que.

**Mechanical Stokers.** — Bulletin No. F106. issued by the Hare Engineering Co., Ltd., Toronto, deals very fully with the "Fulton" water-cooled mechanical stoker. The principal features embodied in the design of the stoker are described in detail and the advantages claimed for this particular type are referred to at length. The illustrations include exterior views of a number of installations under different types of boiler, also longitudinal sections showing the general arrangement of the various parts. The concluding pages show a combustion-draft curve and also contain a description of the "Theco" damper regulator. A number of testimonials from users are included.

**Theory and Practice of Sherardizing** is the title of a booklet written by Dr. Samuel Trood for the United States Sherardizing Co., Newcastle, Pa. The booklet contains a scientific explanation of what the sherardizing process really is, and the practical conditions under which it should be employed. A great deal of valuable information is given in this booklet on the subject and also a detailed description covering the application of this process. In addition, the advantages and disadvantages of different processes of protection of iron and steel against corrosion are discussed at length. The illustrations show different views of a sherardizing plant and a diagram entitled Rust Protection is also very instructive. Copies of this booklet may be obtained from Chambers, Ltd., Don Esplanade, Toronto, who hold the Canadian rights for this process.

# CLUTCHES

**Combined Jaw and Friction. Friction only Gas Engine Clutches. Jaw Clutches.**

Write for interesting printed matter.

**The Positive Clutch & Pulley Works Ltd.**

MONTREAL Factory: Aurora, Ont. TORONTO

**20 TIMES THE SERVICE**

That's what this self-hardening, high-speed steel chaser does for the LANDIS DIE.

Four long cutters tangentially disposed to the work carried in suitable holders make an ideal cutting condition. This, along with its many other distinctive characteristics, has established for us a world-wide reputation.

WRITE FOR CATALOGUE NO. 21.

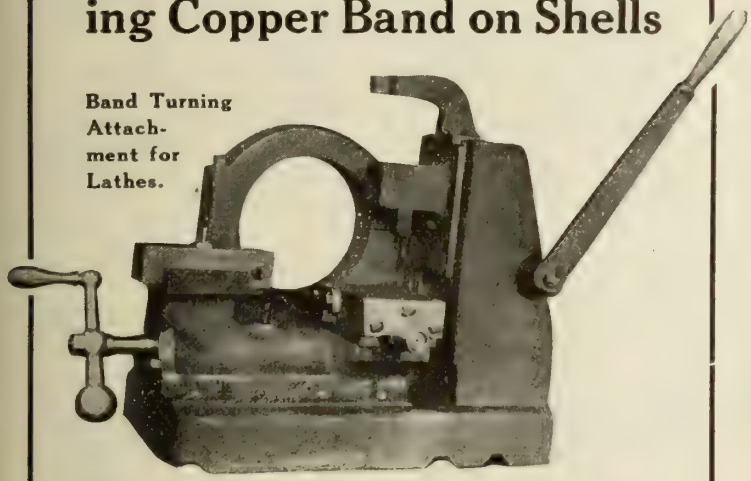
# A Time-Saver for Turning Copper Band on Shells

**Band Turning Attachment for Lathes.**



This attachment will fit any engine lathe, and with its use you can turn the copper band on Shrapnel Shells down to size required and burnish them *all in one operation.*

With this device we will guarantee an output of

**50 Turned Copper Bands per Hour**

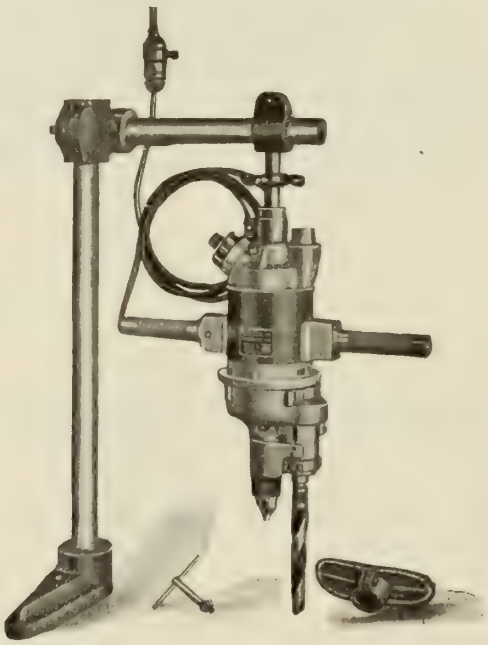
Used with a specially constructed steel chuck, casting of which can be finished on the lathe on which the attachment will be used.

Castings are supplied by us.

*WRITE FOR PARTICULARS.*

**LYMBURNER LIMITED**
**5-15 Commissioners St. Montreal, P. Que.**

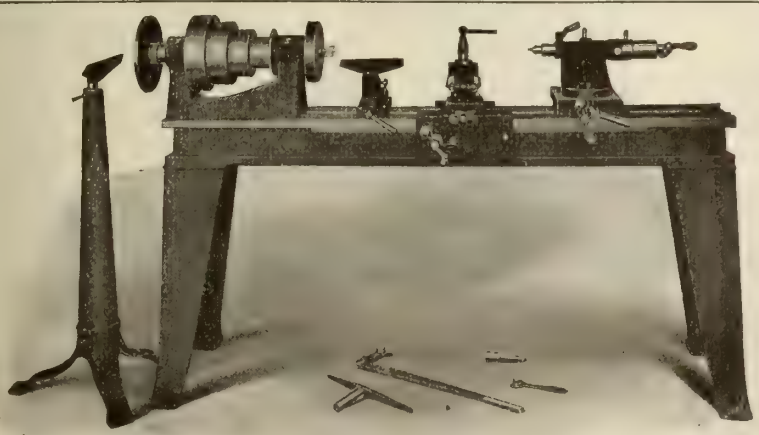
# Stow Two Speed Two Spindle Drill



The only tool of its kind on the market. Fills a long-felt want. Will cut your cost.

**We sell drills of every size.**

**STOW MFG. CO., Binghamton, N.Y., U.S.A.**
**London, England, Stock: 85 Queen Victoria Street**
Oldest Portable Tool Manufacturers in America.



# Patternmakers' Lathe

**(16 inch Swing, 6 ft. Bed)**

Equipped with a hand carriage having rack and pinion feed in addition to regular hand rest.

The **Spindle** is of high carbon steel and runs in **self-oiling bronze bearings.** Outer end of spindle is threaded for face plate to turn work of a large diameter.

**Tail** stock has graduated swivel base. The base has set-over slide operated by a ball handle, so that same may be fed crossway of the bed, a feature very desirable for boring or turning.

HAS NO EQUAL WHERE EFFICIENCY AND ECONOMY ARE REQUIRED.

May we send full details?

## Brown & Sharpe Plain Grinding Machines for Fast Production.

Here is our No. 16 Plain Grinding Machine with a capacity of 10" in diameter and 72" in length, one of our line of five manufacturing grinding machines of various sizes. In addition to the time-saving feature of quick-feed and speed changes, look at some of the other good points. There is the automatic cross-feed which automatically sizes the work, and is set to quarter-thousandths without reference to graduations; combination back rests which support with correct pressure either heavy, medium or light-splined work; massive parts and convenient arrangement of levers. Send for a full description showing why they are economical.

## Save Grinding Time, Get the Right Speed and Feed Quickly

No trouble getting the right combination of work speed and table travel, no temptation to let a wasteful combination stand on B. & S. Plain Grinding Machines. It's a quick and easy operation to shift from one job to another. See in the cut how simple it is to change the rate of table travel, while the work speed case at the right is operated in the same manner. Both are self-contained and independent. A driving belt to the work prevents gear marks.

# GRINDING STEEL CASTINGS

in a swing frame grinder furnishes the most severe test of the worth of a grinding wheel. It's in work of this sort that the superiority of Norton Alundum Wheels is most clearly demonstrated.

Properly selected Alundum Wheels keep clean and sharp—and produce a finish it is impossible to equal by any other means.

# Some of the Reasons Why

**Kromax Packings**

**Are Better Than Others**

First: Kromax Packings withstand oil pressure as well as water pressure.

Second: Kromax Packings withstand double the heat of oak tanned packings and more heat than any packing now on the market.

Third: Kromax Packings cause less friction loss.

Fourth: Kromax Packings are good for any pressure up to 10,000 lbs. per sq. in.

Fifth: Kromax Packings wear longer.

As large users of packings in our own line of hydraulic machinery, consisting of Jacks, Presses, Pumps, Accumulators, Valves, etc., we have been able to prove these claims.

*Write for our brochure, "KROMAX" "Leather Packings that are guaranteed."*

WHEN you need new equipment or supplies for your machine shop

**Consult this Directory**

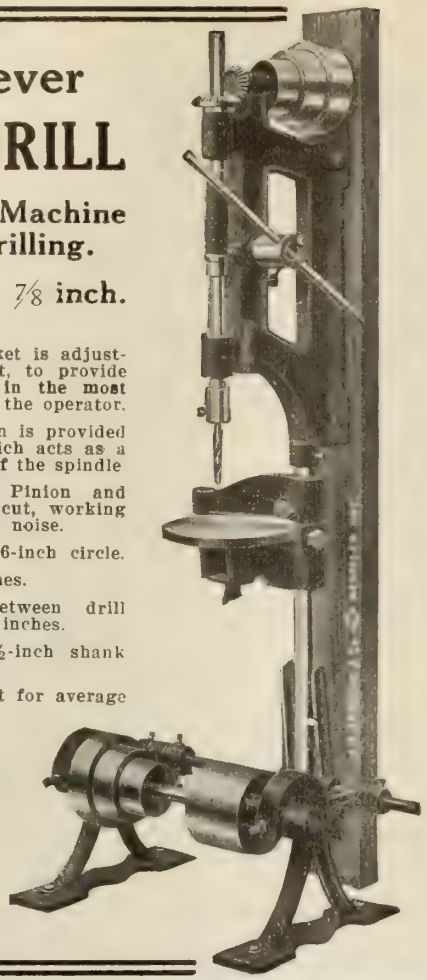
¶ You'll find listed here the reliable makers of the lines you need; firms who believe in the progressiveness of present-day manufacturers and who appeal to their intelligence through their own engineering journal.

¶ Consult Canadian Machinery Buyers' Directory and you can't go wrong in your buying.

## 16 in. Lever
# POST DRILL

**A Giant Little Machine For Light Drilling.**

**Will drill up to 7/8 inch.**



The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

Drills to centre of 16-inch circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 23 inches.

Spindle bored for ½-inch shank twist drills.

Speed of countershaft for average work, 300 per minute.

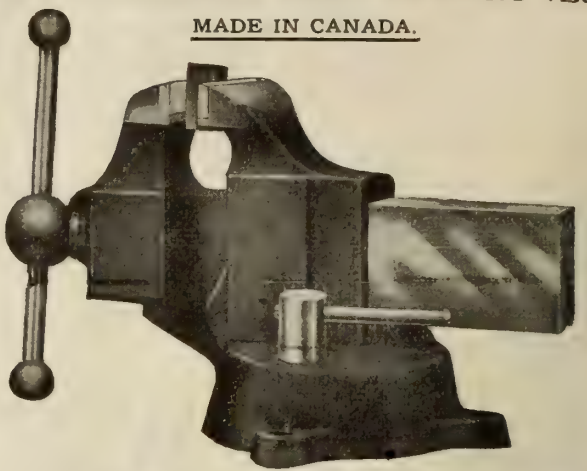
**A. B. Jardine & Co.**

**Hespeler, Ontario**

# The YOST

**Solid Jaw and Swivel Bottom Machinist's Vise**

MADE IN CANADA.



A vise with a grip like grim death; a durability that defies time and the hardest usage.

A vise that will give you a lifetime of perfect service and satisfaction. The metal in a Yost Vise is of faultless quality, perfectly distributed and the workmanship is

***Incomparably Good***

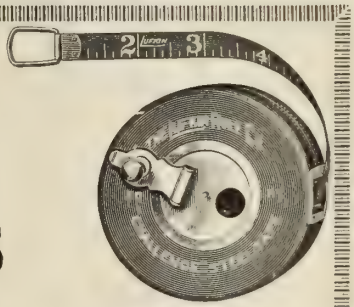
The National catalog would certainly interest you. Write us, asking for a copy.

**National Machinery & Supply Co., Ltd.**

HAMILTON - - ONTARIO

**This Guarantee Goes With Every Vise:** We fully guarantee all of our Vises to be satisfactory in every particular and will promptly replace, without cost, any parts broken or badly worn when such failures are due to faulty material or construction.

# LUFKIN



# TAPES AND RULES

## NOTED FOR ACCURACY

We make a complete line of

MACHINISTS' SCALES — MEASURING TAPES
FOLDING STEEL RULES — WOOD RULES
FOLDING BOXWOOD RULES
SPRING JOINT RULES

Our goods are stocked by prominent hardware and supply houses throughout the Dominion. They are fully guaranteed.

**Catalogue on request.**

THE LUFKIN RULE CO. OF CANADA, LTD.
WINDSOR, ONT.

# Keep Up The Connection

you have made by past efforts in advertising. New friends are alright, but it is a fallacy for one thing, and bad business for another, to create a demand for goods or service and then lose the fruits of your work by default. Letting your old friends know that you want their business is also the surest way to gain new ones.

Advertising in CANADIAN MACHINERY is the medium.

Rate Cards and full particulars on request.

# CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS--Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5.00 per line a year is charged to non-advertisers.

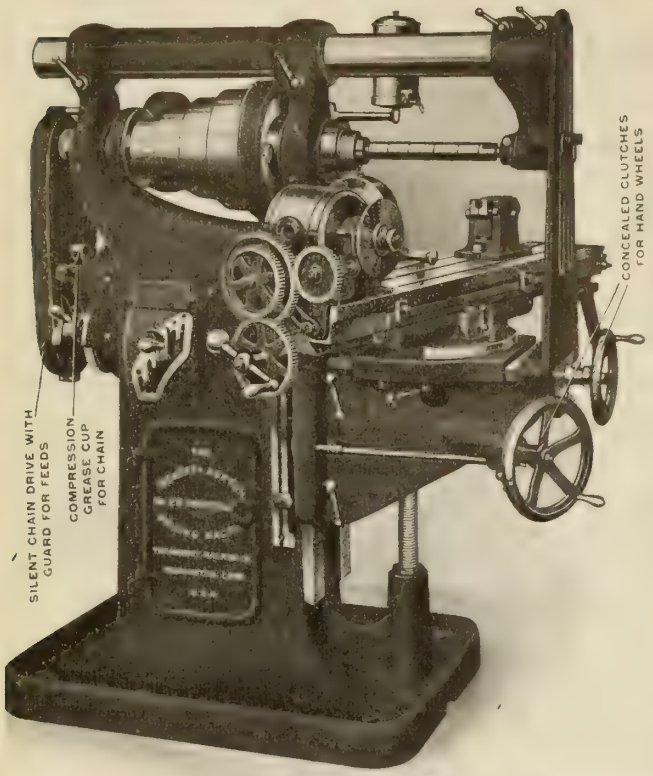
# No. 2B UNIVERSAL MILLING MACHINE



## Sets a new high-mark for efficiency and economy

Main Spindle has taper journals which run in annular bearings.

Constant lubrication is assured by ring oilers which revolve with spindle and pump oil from reservoirs underneath bearings.

Thrust is taken on front bearing, and journals have independent adjustment in either bearing.

Feed Shaft is driven from spindle by heavy silent chain pro tected with complete guard, supplied with compression grease cup for lubricating chain and sprockets.

All Feeds positive driven through gearing, giving 18 changes.

Automatic Feeds can be operated simultaneously and reversed while machine is in motion.

Feed Gearing is Hardened and feeds have independent controls.

Vertical and Cross Feed Hand Wheels have concealed clutches in hubs which allow wheels to run free on shaft when not employed.

Dividing Head is cylindrical in pattern. Supporting Block for Spindle is carried by side plates which recess into block and have annular bearings in ring of main frame.

# Starrett Combination Set

A Starrett Combination Set is a complete instrument based on the original combination square invented and patented by L. S. Starrett. It combines on one grooved blade or rule three sliding heads as follows: A square, a protractor, and a center head.

## Where Used

The tool may be used with any of these heads singly or in combination. It is useful in laying out all kinds of work, especially jigs, dies, etc., and in testing progress as work is done. There is a spirit level in the head of the square and also a scriber for laying out work.

## Quality of Graduations

The blades of Starrett Combination Sets are graduated by the special Starrett process, which insures cleaner, sharper, finer graduations than is possible with any other method.

## Two Styles

These Combination Sets are made with cast iron heads or drop forged heads, as preferred. The drop forged head is hardened and is more durable but is also more expensive. The graduations on the blade are metric or English, as preferred.

## Sizes

The tool is made in the following sizes: 9", 12", 18", and 24", with prices from $3.75 to $5.75, depending on size and style.

# The Tap with the
# Con-eccentric Land
## For Tapping Nuts

**One-third of the land from the cutting edge is concentric. The remaining two-thirds has eccentric relief.**

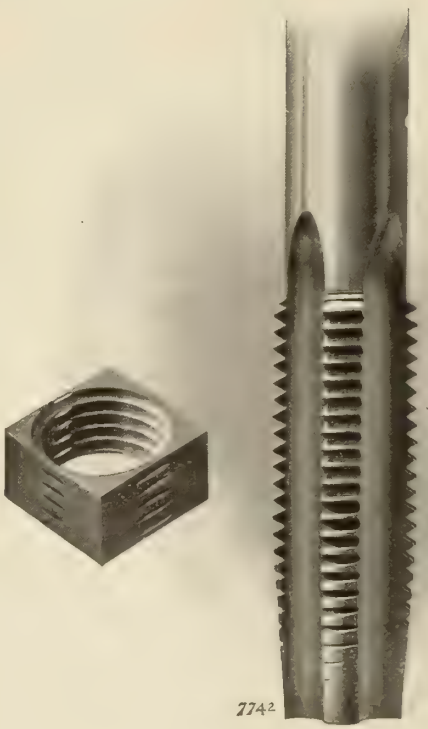
TO show more clearly the free-cutting qualities of these taps, a nut slightly smaller than one and one-quarter inches square was drilled for tapping and held lightly by the corners. The nut was then tapped with a 1¼-7 U.S.S. con-eccentric tap, driven through without reversing. (See cut on right).

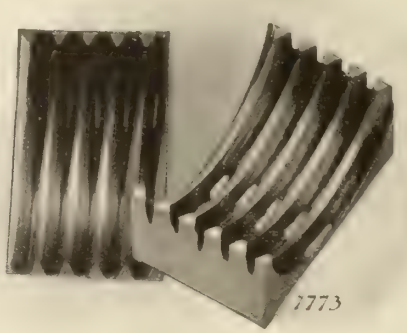
So perfect were the cutting qualities and so easily and freely was the work done that this mere shell of a nut was *not even distorted,* to say nothing of being split as would have happened with a tap differently constructed.

Consider what this means to the nut manufacturer from the standpoint of a *saving in power.* This is but one reason why Pratt & Whitney taps are specified by the largest nut manufacturers in the country.

For a number of years we have made taps with this style of relief. They have won out steadily and consistently on merit alone.

**Write for our Booklet "The Tap with the Con-eccentric Land"**





TAPS can be sharpened at the only correct point — on the face of the cutting edge.

Sharpening in no way affects their size.

Can be sharpened long after other so-called eccentrically-relieved taps are rendered useless.

We obtain the freest cutting tap with the longest life—an exclusive combination.

Accuracy nowhere else obtainable is secured together with a degree of finish and refinement heretofore thought impossible in a commercial tool.

We want tap users to know *why Pratt & Whitney taps are best,* also that our claims are based on reasons mechanically correct.

Cut to left is a tapped nut sawed in half showing small area of metal which held it together.

The taps are carried in stock by our Branch Offices and Agencies throughout the world. Prompt service assured to all customers wherever located.

## PUBLICITY AS A BUSINESS ALLY

You as a manufacturer have particular interest in Canadian Machinery because it represents you and reaches your sales prospects. It should have your interest because it represents your interests.

In exactly the same way, several thousands of manufacturers and plant officials throughout Canada read Canadian Machinery because it represents them and their business. It holds their interest because it represents their interests.

Germany has given us an excellent example of the advantages gained by being prepared. This should be your building-time—the preparing time. Good solid publicity for your product and your name will place you in the advance trenches, in the industrial development that is bound to come.

*Why not enlist Canadian Machinery* (and its army of readers) as an ally to your selling force? Delay is nearly always unprofitable.

*Rate cards and full information will be sent on application.*

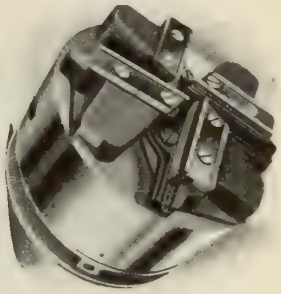
## In Scientific Selection The Landis Die Predominates



Because,—

The length of the chasers increases its life from ten to twenty times that of the hobbed die.

The line contact the chasers have with the work minimizes the friction at the cutting edges and permits of a much higher cutting speed.

Of the interchangeability of the chasers, which means any one or more of a set can be replaced without renewing the entire die.

Of the right and left hand threading with the same set of dies, a feature accomplished by grinding the opposite ends of the chasers and using right and left hand chaser holders.

Of the uniform hardness of the chasers, which makes it unnecessary to anneal, hob or retemper the die.

# Making Shrapnel Cases

presents some interesting problems. A vast number of these busy little agents of destruction are now being turned out in Canada and United States for the war in Europe—a good percentage being machined by tools treated in

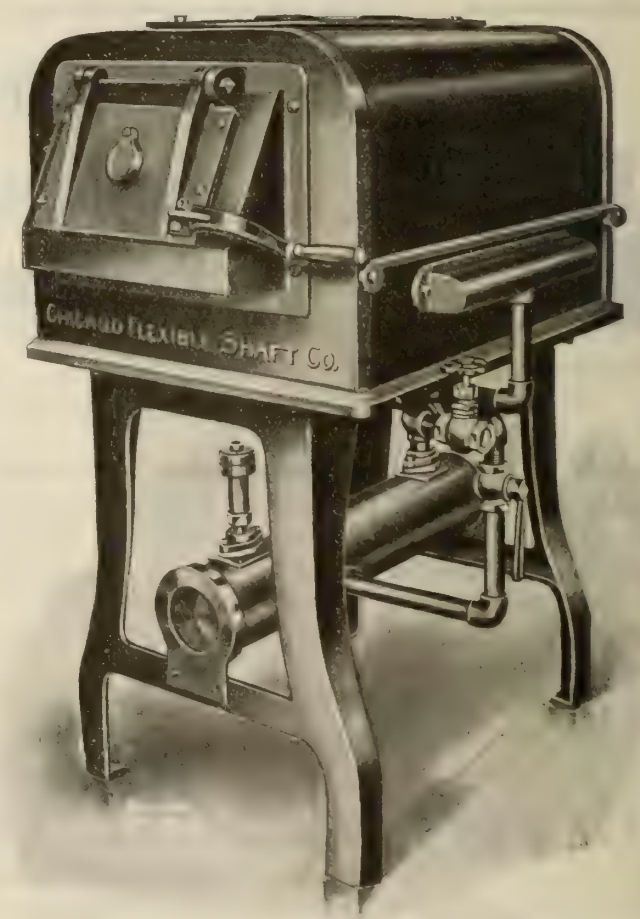
# STEWART GAS and OIL FURNACES

*"They Keep Your Tools Fit"*

The simple method of Heat Control enables the operator to get the **right** temperature for hardening or tempering the tool being treated and to hold it indefinitely.

Modern shop practices have rendered obsolete the old guess-work of heating objects to be hardened in an open fire and dumping them into water when the manipulator "thought" they were at the right temperature.

**Put your Heat Treatment of metals on a scientific basis—it pays. Write us for details on the 100 odd types of STEWART FURNACES.**



## Chicago Flexible Shaft Company

**210 to 230 Ontario St. Chicago, Ill.**

# Making Cartridge Cases

for rapid-fire guns requires some rather complex drawing operations, together with a larger number of annealing treatments.

If your work includes similar operations—scores of Canadian plants are devoting their attention to making munitions of war.

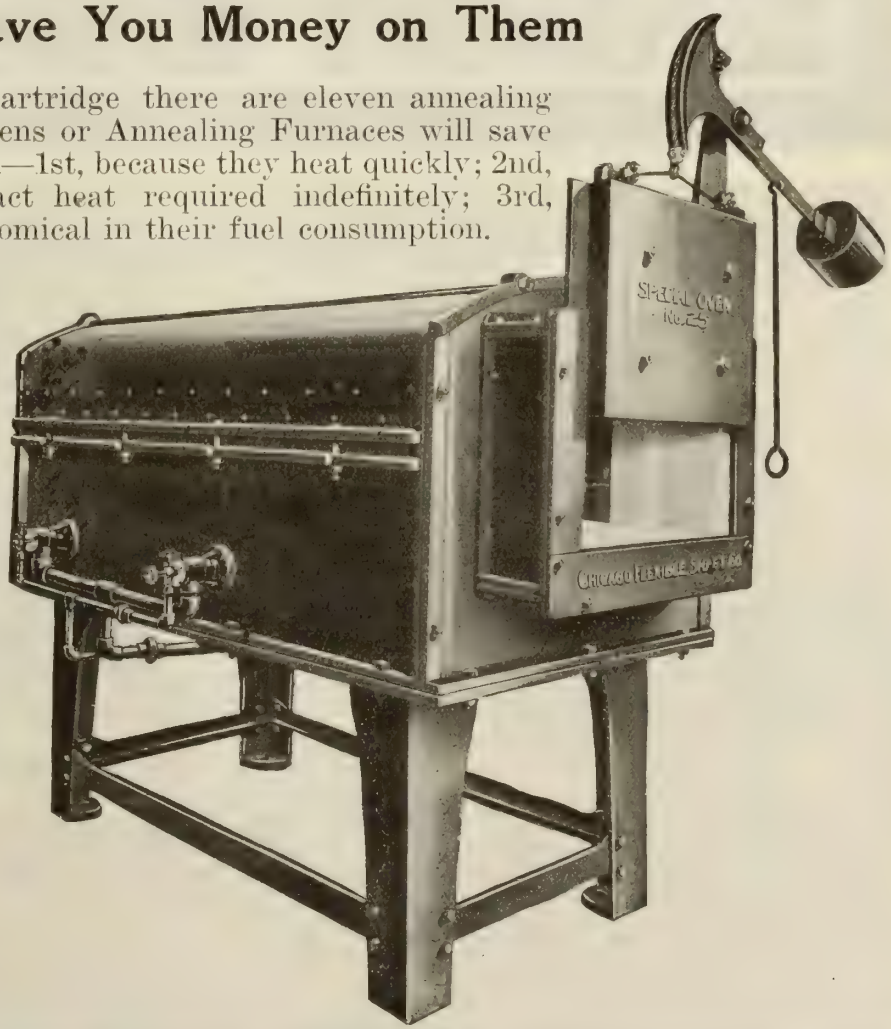
# STEWART GAS and OIL FURNACES

## Will Save You Money on Them

In the making of a 6-in. cartridge there are eleven annealing operations and Stewart Ovens or Annealing Furnaces will save money on every one of them—1st, because they heat quickly; 2nd, because they hold the exact heat required indefinitely; 3rd, because they are very economical in their fuel consumption.

Whatever your requirements we can fill them.

Besides our standard types we are well equipped to design and build furnaces to handle any special requirements in the heat treatment of metals.



**We Offer**

to prove every statement at our own expense. We will send any Stewart furnace you may select for a thirty days' FREE trial. Don't pay a cent unless it lives up to the guarantee. Write for details.

**Chicago Flexible Shaft Company**
**210 to 230 Ontario St., Chicago, Ill.**

# GRINDING STEEL CASTINGS

in a swing frame grinder furnishes the most severe test of the worth of a grinding wheel. It's in work of this sort that the superiority of Norton Alundum Wheels is most clearly demonstrated.

Properly selected Alundum Wheels keep clean and sharp—and produce a finish it is impossible to equal by any other means.

# BIG MEN

## have picked the

Greenfield

We can point with pride to the list of prominent concerns who have selected our UNIVERSAL GRINDING MACHINE for use in their works. Such a list would cover nearly all mechanical lines as well as many famous technical schools and colleges.

Why has the "Greenfield" been chosen?

Because it is simple and rigid in its design; is thoroughly well built; is equipped with a large assortment of practical and convenient attachments; and because it represents greater value in proportion to its cost than can be obtained elsewhere.

Don't purchase a grinding machine for tool room use without investigating what we have to offer.

We also build PLAIN CYLINDRICAL GRINDING MACHINES for production work.

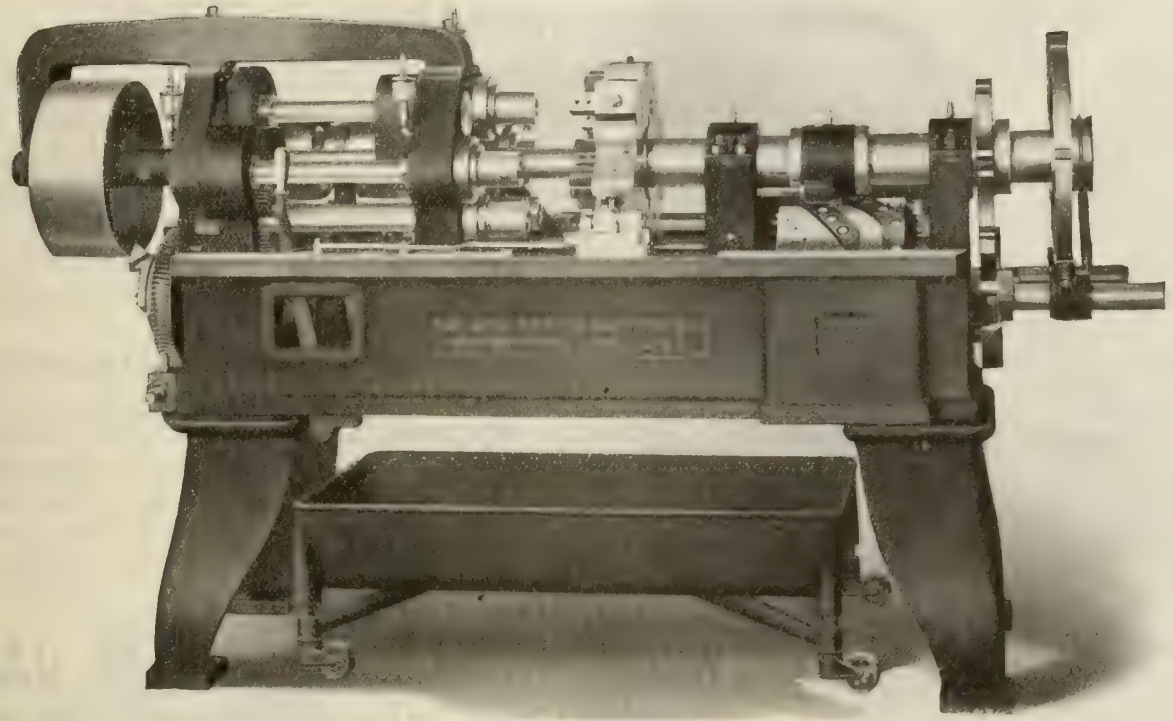
# Automatics for Shrapnel Parts

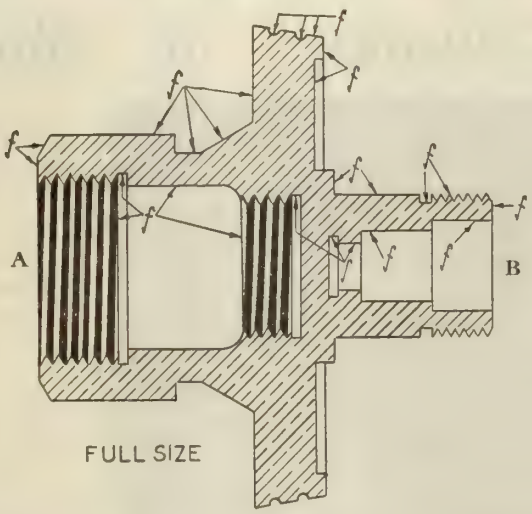


Single Head Machine

## 68 FUSE HEADS PER HOUR!

### Labor Cost: 44 Cents Per 100!

This Fuse Head is finished all over at *two settings* in Size 33 Automatic Five Spindle Single Head Chucking Machine.



### Material: Aluminum

Operations:

End "A"—Turned; faced on flange and end; bored three diameters; recessed inside and out; and tapped two diameters *simultaneously.*

End "B"—Turned and faced on hub and flange; bored three diameters; grooved on outside of flange; hub under-cut inside and out; and threaded.

Our plant is running night and day to meet the demand for "New Britain" Automatics. You may not be manufacturing shrapnel, but if your product contains anything requiring similar operations you will do well to send us sample or blue print and learn how much a "New Britain" would save you per day. Its production runs from 3 to 10 times that attainable by other methods.

***Single Head Machines in Four Sizes***

*Does a 60 to 90 per cent. saving appeal to you?*

***Double Head Machines in Three Sizes***

# The New Britain Machine Company

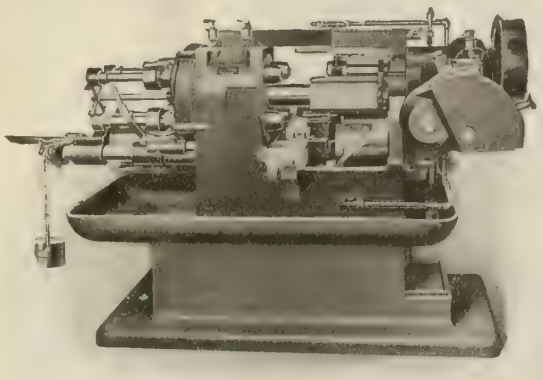
NEW BRITAIN, CONN., U.S.A.

# Gridley Automatics

## SINGLE AND MULTIPLE SPINDLE

Gridley Automatics **GUARANTEE ACCURACY** because the stiffest and most effective type of cutting tool can be rigidly held close to the work without overhang.

"GRIDLEY" Multiple Spindle Automatic



Each tool is supported close to its cutting point, which completely obviates the spring and consequent inaccuracy which cannot be overcome when a necessarily long tool is held by its shank, as is the case with all other automatic turret lathes.

GRIDLEY AUTOMATICS **GUARANTEE A LARGE OUTPUT** because the rigidity of the tool permits heavier cuts and coarser feeds, and its form insures the highest efficiency, while the arrangement upon the tool slide allows for the use of tools tandem, and thereby doubles or trebles the work of a single operation.

**Our catalog,** CONTAINING OTHER DISTINCTIVE GRIDLEY FEATURES, **is ready for mailing.** Be sure to ask for a copy.

# ACME

## Cutting Lubricant used on Shrapnel Shells

The above photograph shows a shrapnel shell being machined on an Engine Lathe with Acme Cutting Lubricant.

Keeps the tools cool, furnishes sufficient lubrication, prevents excessive wear.

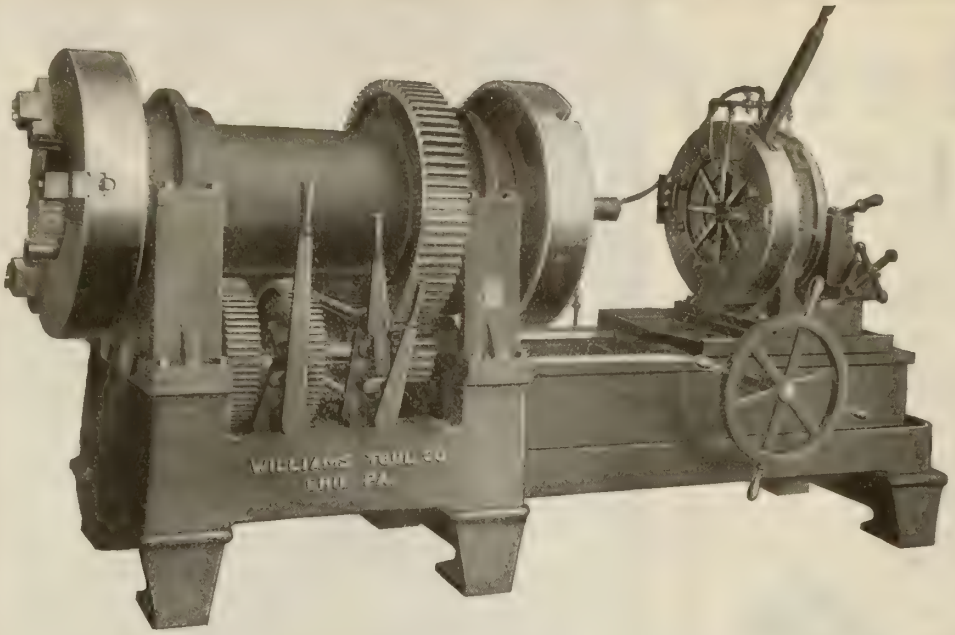
Works equally as well on Turret Lathes, Milling Machines and Bolt Cutters.

Leading Manufacturers use it on shell work in preference to oil; costs less and increases production.

**We solicit your trial order and will ship on thirty days' approval, subject to practical test.**

**Cataract Refining Co., Limited**

**Toronto, Ont.**



The gas light was a big improvement over the tallow dip, but it had to give way to the electric light; and the Tungsten has superseded the little glimmer that once delighted us.

If you are still employing pipe-cutting methods as antiquated as the tallow dip, you need a Williams Pipe Machine, which occupies the same position in the pipe-cutting field as the Tungsten does in the lighting world, to bring you up-to-date.

*Let us quote you prices and terms: any machine to cut 10 sizes of pipe between 1-4 inch and 18 inch, with any kind of power.*

**Anyone making, selling or buying a pipe machine, claimed to be a Canadian-made Williams Pipe Machine, does so without right or authority from us, and is liable to prosecution for damages.**

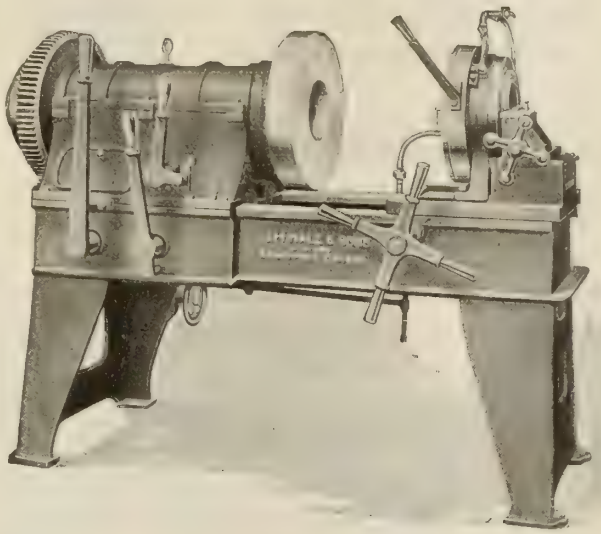
# THE HALL NO. 6 PIPE MACHINE

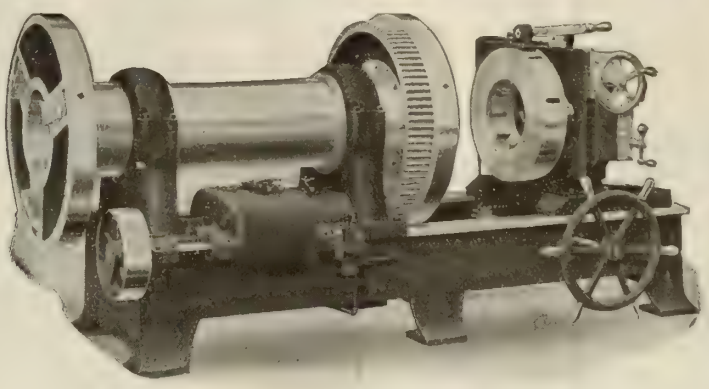


When you buy Hall Machinery you keep Canadians employed. We are a Canadian firm, employing none but Canadian labor. Our guarantees are not at "Long Distance." We are at your door.

Our Machinery is the best that mechanical ability can produce and does not cost as much as imported machinery.

Write us for catalog and prices on pipe-threading lathes, any capacity, from 1/8 to 18-in., also single and double head rapid nipple machines. No delays, delivery from stock.

## JOHN H. HALL & SONS, LIMITED
### BRANTFORD, CANADA



## Performance

When 230 pipe machines of the same make are sold in one city—when 158 are sold in another. When 65 out of 85 concerns in one city placed repeat orders—when one firm placed five repeat orders—performance of the machines must have played an important part. Such a record could not follow a machine unless it was an "honest to goodness" pipe machine. Each machine must have performed its part each working day, or it would have been branded a failure.

*Send for a catalog of the machine with a performance record.*

# CLEVELAND SAND RAMMERS

## FOR FLOOR, BENCH, PEIN AND FLASK RAMMING

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts — Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

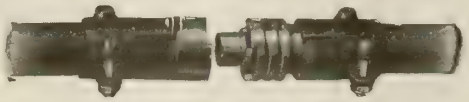
### CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

### BOWES AIR HOSE COUPLINGS

**Over 1,000,000 in General Use**

**Bowes Couplings are instantly connected or disconnected.**



**Bowes Couplings are absolutely air tight under all pressures.**

# Frictional heat causes other babbitts to "burn out," where Magnolia Metal remains cool and gives entire satisfaction

**Extracts from a Letter**

Palisades, Colo., January 10th, 1915.

Gentlemen:—

I had an excellent opportunity of comparing Magnolia with a reputable Pump Co.'s own composition which would not stand the severe test and burned out in twenty minutes.

It was a Marine type thrust bearing on a 24" Volute Pump working under 190' head, with suction on one side of impeller only . . .

The safe load for bearings of such design is 60 to 100 lbs. per square inch, according to text books, . . . but Magnolia actually stood up under conditions which the experts said were beyond the safe limit . . .

I ran Pump at 495 r.p.m. under such conditions practically continuously, excepting short shut-downs due to ditch troubles, for three and one-half months, and finished the season's run with the one Magnolia casting or pouring, and found bearing in excellent condition after shutting down.

H. F. HENDERSON, Machinist,
Orchard Mesa Irrigation District.

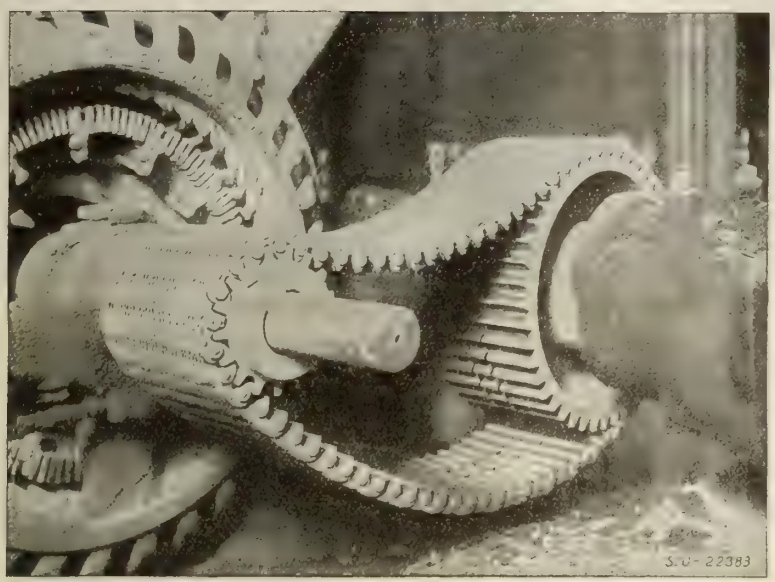
# MORSE Silent Chains



## In a Cement Plant

The owner of the drive illustrated says:

"There is no doubt, in my mind, that the direct application of the individual motor is proper in cement mill practice, and that the ideal drive is the noiseless chain gear, combining the flexibility of a belt with all the good features of a gear."

Details of the drive follow: 50 H.P. MORSE Silent Chain driving Stone Crusher. Chain 1.2" pitch, 8" wide, speed 1225 F.P.M. Sprockets, 17 and 45 T, 720 and 270 R.P.M., 26" centers.

## Protection

Speaking further regarding drives in his mill, the owner says:

"We took up the question of dust protection in great detail with the chain manufacturers, as it appeared to us a troublesome feature. Upon their advice, we are running our chain drives openly without any dust guards and the wear, so far, has been minimum."

You may not be interested in a Cement Mill, but if you use power at all, you are interested in a drive so satisfactory under cement mill conditions as MORSE Silent Chains.

## PATTERN GEARS

**(Hamilton Gear & Machine Co., Toronto)**

Metal patterns with accurately machine-cut teeth solve some of the difficulties in the use of moulded gears. For repetition work they are a necessity.

It is essential to know the exact shrinkage of the iron to be used.

Very little draft is required on machine-cut patterns. For narrow-faced gears of moderate size no draft is needed on the pattern. By using a stripper plate with machined teeth quite wide-faced gears may be moulded without draft.

For bevel gear patterns we recommend the twenty degree involute tooth form. This gives a much cleaner draw from the sand, there being no approach to undercutting at the root of the tooth. For the same reason it is a stronger tooth. We are equipped to cut this form as well as the usual fourteen and a half degree involute in bevel gears up to about sixty-two inches outside diameter.

# Shrapnel Shell Manufacture

## Shell Department of a Canadian Railroad Shop

Staff Article

*The equipment of our up-to-date railroad and motive power establishments compares perhaps more than favorably with most mechanical engineering institutions in its adaptability and general readiness to extend the scope of its operations, hence small wonder is it that the illustrations and description which follow will be found to show that as regards shell production, this chosen plant is well to the front in its every feature requirement.*

WHEN it was first suggested that shrapnel shells be made in Canada, there were many men whom past experience had taught us to consider as authorities in the engineering field, who thought that it would be impossible for Canadian shops to take up this line of manufacturing. Nevertheless, there were also other engineers, for whom we now have nothing but the highest praise, who were determined to investigate the proposition for themselves, and it is to these latter that we, to-day, can attribute this nation-wide industry of shell making.

As we enter any shop engaged in the manufacture of shells we have our interest at once keenly aroused by the many ingenious tools and fixtures that are being used, but to enter one of the shops which were among the pioneers in this business, our interest increases three-fold. In the matter of this railroad shop, now turned into an arsenal, it has to be borne in mind that here many of the fundamental problems were solved. Many of the tools, etc., now being successfully applied in shops all over the Dominion had their origin here also, facilities having been given those concerned to inspect and carry away such information and data as would enable them to build simple tools, jigs and fixtures to place on their existing machines.

The engineering staff, having in the past been pitted against innumerable problems that any great railway always experiences, felt confident that, if it were possible to make shells on standard machine shop tools, they at least could do it. Spurred on by patriotic motives, they went right into the problem, and, to-day as a result, have evolved one of the most extensive shell manufacturing institutions in our Dominion.

It has been the practice of the plant, as the output increased to have many of the roughing operations done in smaller nearby shops, they themselves utilizing all their own machines and skilled men in carrying out the finishing operations. About half the number of shells finished, however, receive their roughing operations in the plant.

CONSTRUCTIONAL FEATURES AND DIMENSIONS OF BRITISH 18-POUNDER SHRAPNEL SHELL.

### First Operations.

The cutting-off of the ragged ends of those shells roughed by the company, is done on an ordinary cutting-off machine not situated in the shell shop but in the main machine shop of the plant. The machine in times of peace is used for cutting off crank pins, wrist pins, etc. Although a very substantial and serviceable machine, and still doing excellent work, it shows signs of having done its share of hard duty and long since it seems to have parted company with its name plate. The shell is placed on the machine and its length marked off with the special scratch awl shown in Fig. 1. A portion of the shell near the outer end is "chalked," and the awl is placed in the shell as shown in Fig. 1, the proper distance from the inside bottom of the shell being marked on the outside. The shell is then chucked in a three-jaw universal chuck and a parting tool fed into the work. Thus, the first roughing operation is accomplished. Test-

ing with the gauge shown in Fig. 2, follows. The point of reference for this first cut was the bottom of the powder pocket, and in the finishing of the back ends of the shells, here the point of reference is the surface that has just been machined.

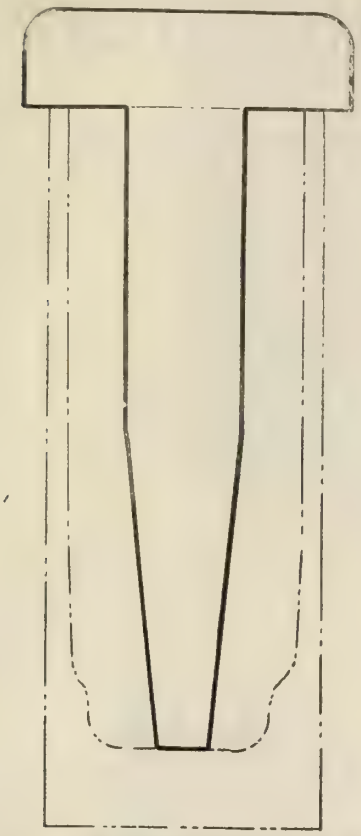

FIG. 2. GAUGE TO TEST LENGTH OF SHELL AFTER TRIMMING OPEN ENDS.

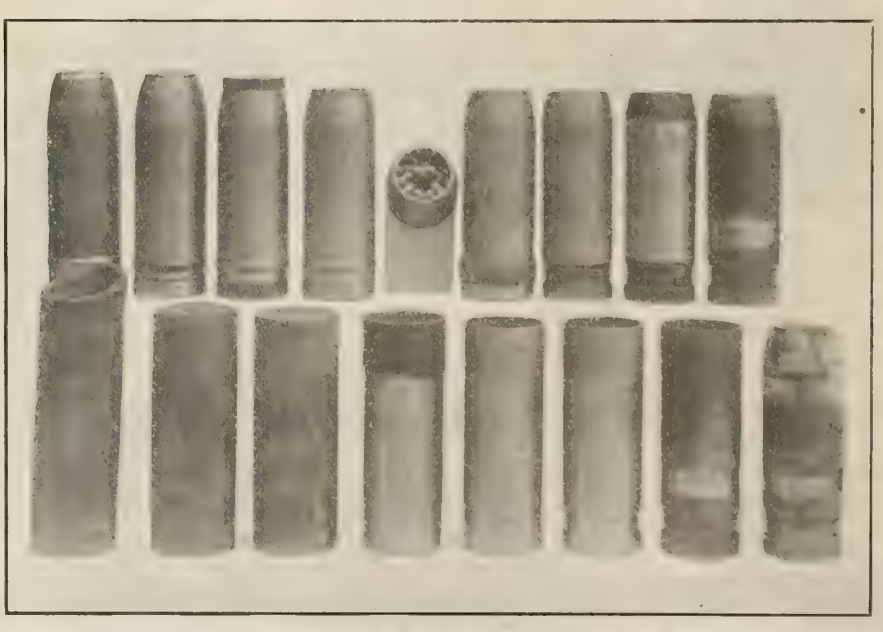
The back ends are milled off on two similar vertical milling machines, one of these machines being an Alfred Herbert, Coventry, England, machine, and the other a Smith & Coventry, Manchester, England. On the table of each, a similar jig, which accommodates three shells, is placed. The shells are pushed into the jig, open ends first, until the faced open ends come against a a stop. Set screws clamp the shells tightly in the jig. The table is moved in to a stop and then traversed by power, causing the solid milling cutter $2\frac{1}{2}$ inches in diameter to pass over the face of the shell in about two minutes. The cutting is practically continuous, as finished shells can be removed and new ones put in place while the machine is cutting. Soda water cutting lubricant is used in the cutter, the supply being obtained from a belt-driven centrifugal pump. As will be seen in Fig. 3, the jig is extremely simple and the production of the machines is good. Fig. 3 shows the Alfred Herbert machine, the Smith & Coventry machine being very similar in design. After these two operations are completed the shells are carried over to the shell shop proper on trucks running on the standard gauge industrial tracks installed about the shops and adjacent yards.

### Rough Turning Operation.

The shells pass on to the rough turning lathes immediately that they enter the shell shop proper. The company had fitted up some turret lathes with more or less elaborate tooling on the turrets to take care of all the roughing operations, including the turning of the driving band groove and the finishing of the back end of the shell. However, after a more or less extensive series of experiments it was found to work out to better advantage to have each machine tooled up to accomplish one simple operation. The men become more expert and there is no elaborate system of tooling to become deranged.

Various types of machines are fitted up for the rough turning and facing of the ends of the shells. The first machine is a Gisholt turret lathe. This has a hollow spindle and to the face plate is bolted an expanding chuck, shown in Fig. 4. Fig. 5 also shows this chuck attached to the Gisholt lathe. The end of the central spindle acts as a locating stop for the shell. This stop comes in contact with the bottom of the powder pocket. Three expanding jaws grip and centre the outer end of the shell, these jaws being expanded by the tapered central rod of the chuck. This central rod goes through the hollow spindle of the machine and a handwheel is attached to the extension of the rod. The rod passes through a stationary nut, and hence, when the handwheel is turned, the rod is caused to move. The inward movement of the tapered portion of the rod gives to the jaws their expanding motion, while the outward movement of the rod releases the jaws. However, to ensure the jaws always withdrawing from the work, a groove is turned in these jaws into which is inserted a little coil of spring steel wire, the ends of which have been joined to form a circle. This coil spring is extended when the jaws are expanding, and thus, when the tapered portion of the central rod removes its pressure from the under side of the jaws, these jaws are pulled from out of contact with the shell. The inner end of the shell is held securely by the closing down of the three set screws.

FIG. 1. SCRATCH AWL FOR MARKING OFF LENGTH OF SHELL BEFORE TRIMMING OPEN ENDS.



SHELLS IN PROCESS FROM THE FORGING TO THE PRODUCT AS COMPLETED IN CANADA.

one of which is shown in Fig. 5. A turret tool-holder is used to carry the three tools used in this turning operation, the main turret not being used. The first tool is the roughing tool which rough turns the shell up to within two inches of the open end, where an automatic stop throws the power carriage feed out. A snap gauge is used to caliper the work. Next the turret tool post is turned and a finish turning tool is fed into the work. This tool turns the shell to finish size up for a distance of 1¾ inches, this distance being measured off with a steel scale. A limit gauge shown in Fig. 6 is used to caliper the diameter. When this has been done, the back of the shell is faced with the same tool, the tool slide being travelled across the carriage by power feed.

The final operation on this work is done with a third tool, carried in the turret tool holder. This tool merely cuts the 1-10 inch radius on the end of the shell. Soda water lubricant is used on practically all operations, each machine being equipped with a small soda water pump belt driven from the counter shaft above the lathe.

The next lathe is a Dean, Smith & Grace, Keighley, England, engine lathe,

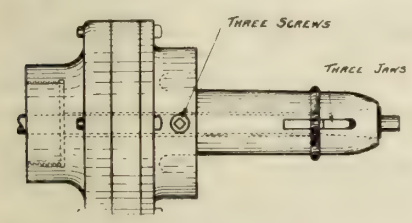


FIG. 4. EXPANDING CHUCK FOR HOLDING 18-PDR. SHELL WHILE ROUGH TURNING AND FACING.

and it is fitted with an expanding arbor or chuck similar to the Gisholt lathe just described. There are, however, four tools in the turret tool holder. Three of these four tools accomplish the same operations as have just been described. The fourth operation is done with a flat tool having its cutting edge ground at an angle to the work so as to form a taper. This tool is fed into the work near the open end of the shell and cuts away the shoulder left by the rough turning tool. The taper prepares the tool for the nosing operation which follows in due course.

Next in line is another Dean, Smith & Grace engine lathe, but it is fitted with a different design of chuck. The shell is driven on a rigid pilot bar, and the open end is centred in a three-jaw chuck with independent jaws. This chuck is not to be compared with the design just described previously, but it is designed to be fitted to solid spindle lathes. The tooling is identical to that just described in connection with the other Dean, Smith & Grace lathe.

The next machine is a John Bertram & Sons, Dundas, Ont., engine lathe. This is equipped with a solid locating bar, similar to the one just described. The tapered portion of the bar which locates the shell has been fluted to increase its gripping abilities. The open end of the shell is centred in a four independent jaw chuck. The turret tool holder is similar to those previously described.

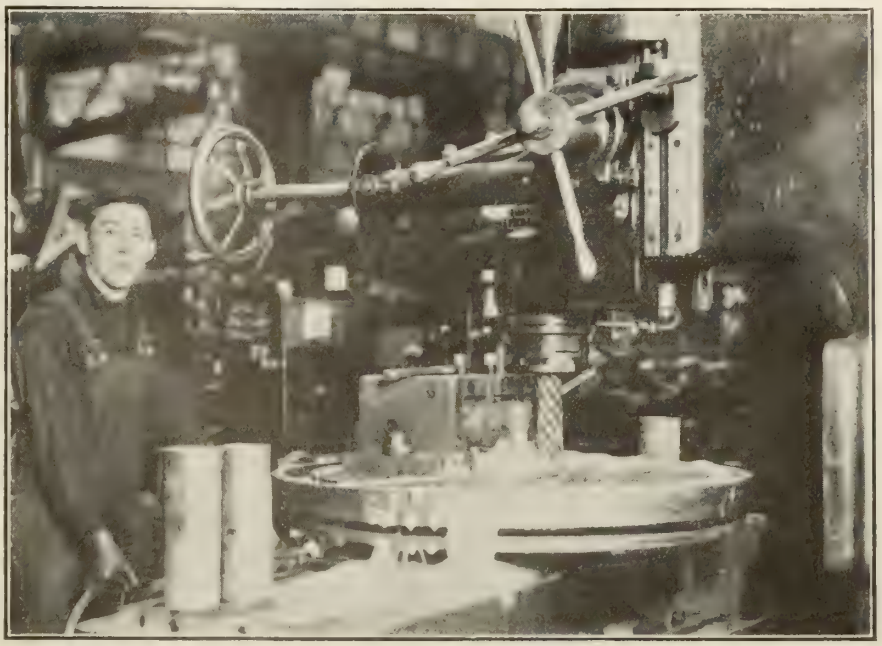

FIG. 3. MILLING BACK END OF 18 PDR. SHRAPNEL SHELLS ON A HERBERT VERTICAL MILLING MACHINE.

### Warner & Swasey Turret Lathe.

The next machine is a Warner & Swasey turret lathe. This is completely tooled up to accomplish all the roughing operations. Fig. 7 shows the machine. It has been fitted up to rough turn the outside of the body, finish turn it up as far as the driving band, finish face the end of the shell, form the radius on the corner and cut the driving band groove with its waved lines. However, to make the production of the shops a maximum, the operations on single machines have been made more simple, hence the driving band recess is not turned on this lathe. However, the lathe is highly interesting and is described as follows:—

The turret is tooled up, and a turret tool holder is mounted on the cross slide. The lathe has a hollow spindle and the chuck is the same as the one fitted to the Gisholt lathe. The first operation is to face the end of the shell with a tool

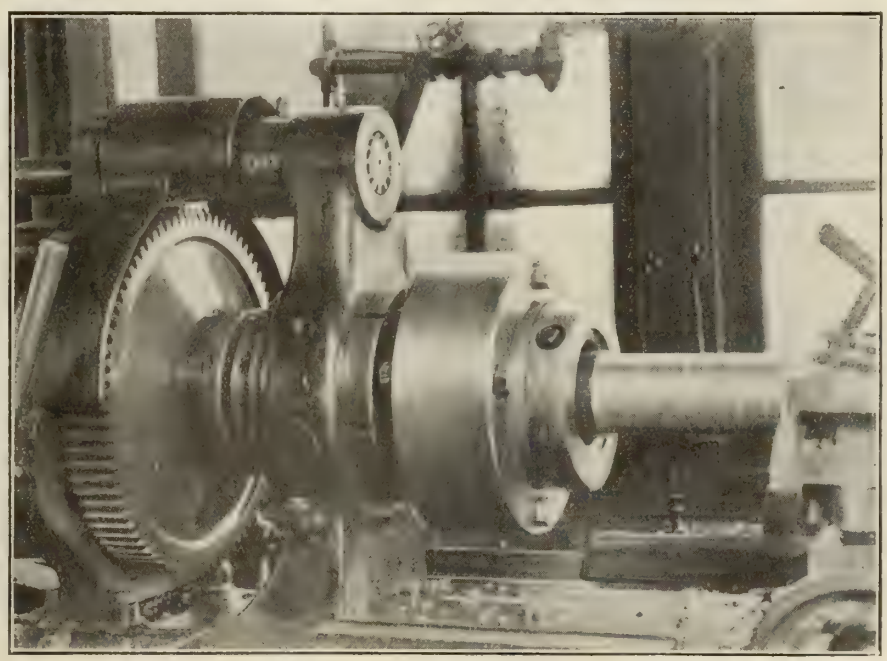

FIG. 5. ROUGH TURNING ON A GISHOLT TURRET LATHE.

carried in the turret tool holder. Then a sharp taper is turned removing the sharp corner from the end of the shell. The rough turning tool follows immediately. This tool is carried on a fixture attached to the turret. The tool is carried in the top of the fixture and the cutting end points downward. In the fixture, two follower rollers are carried. These details can be seen clearly in Fig. 7 which shows the finishing tool (similarly held) facing the front of the cut. The taper turned on the end of the shell with the finishing tool is to enable the follower rollers to easily pick up the work. The next tool is the finish turning tool which finish turns the shell up as far as the driving band. This tool is carried on the main turret also. In both these operations, the turret works up to a positive "stop." The next operation is to turn and form the radius on the back end of the shell. This tool is carried on the main turret.

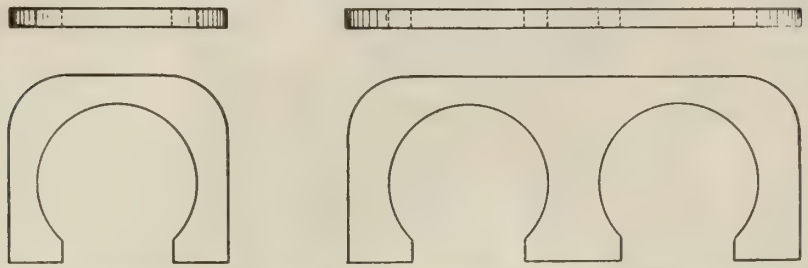

FIG. 6. GAUGES USED TO TEST SIZE OF SHELL AFTER ROUGH TURNING.

Under the present arrangement, these are the only operations carried out on this machine, however, in the earlier days of the shell work the following operations were also done on this lathe:—The turret was swung, and a revolving centre was brought up to support the back end of the shell. A flat tool roughed out and formed the driving band recess. This tool was carried in the turret tool holder on the cross slide, and left enough metal in the bottom of the groove to allow the wave lines to be formed. The turret tool post was swung around and a roller brought into register with a three-point face cam which is bolted on to the face plate of the lathe. The little tool holder is thus given a lateral motion in guides machined for it in the turret tool holder. A stiff spring keeps the roller closely pressing against the cam at all times.

The cutting edge of the tool is so ground that the wave lines are formed when the tool is fed into the work. The cross slide is fed in until a stop is reached at which point the waving tool has cut the central portion of the groove to its finished depth and has cleaned up the bottom of the groove where the former tool has previously cut the edges to finish depth. Next, the main turret is swung, and a fixture on the turret brings two little undercutting tools into position. These tools are fitted in little tool holders which travel in guides that are machined at an angle to the work. By crowding a fixture mounted on the cross slide into the back of the little tool holders, they are fed into the work at the proper angle to do the undercutting, and at the same time they cut the groove to the finish width. This completes the series of operations that can be done on the lathe with its present tooling.

The sixth and last machine used for rough turning purposes is a Warner & Swasey turret lathe. The main turret is not used. A turret tool post is mounted on the cross slide. The shell is chucked as in the case of the Warner & Swasey turret lathe just described, and the Gisholt lathe first mentioned, but two tools are carried in the turret tool holder. The first tool does the roughing cut, while the second tool faces the end of the shell, finish turns it up for a distance of 1¾ inches and forms the radius on the corner.

**Cutting the Driving Band Recess.**

The machining of the driving band recess is accomplished by the methods that have become more or less standard since this industry has been inaugurated in Canadian shops. Several engine lathes are tooled up to do this work. A universal chuck is fitted to each machine and on the face of this chuck is bolted a three-point face cam, made of machinery steel. A turret tool post is mounted on the cross slide, and the tool forming the wave lines is carried on the rear of the cross slide and approaches the work from the back. The shell is placed in the chuck against a stop and the outer end is supported in a revolving centre mounted on the tail-stock spindle.

The first tool to enter the work on this operation is that which roughs out the recess and cuts it to depth for a short distance on either edge, leaving sufficient metal for the wave lines to be formed in the central portion of the groove. The carriage, during this and the immediately succeeding operation is placed against a locating stop and locked there. The roughing tool is fed into the work until the cross slide works up to a stop at which point the outside cutting edges of the tool have cut the groove to depth. Then from the far side of the carriage the tool forming the wave lines is brought into the work. As the tool approaches the work, a roller registers against the three-point cam transmitting a lateral motion to the little tool holder. This tool holder is caused, by means of a spring of flat steel, to follow closely the contour of the cam. The tool slide is then drawn closer to the work and the wave forming tool enters, forming the wave lines and cleaning up the bottom of the recess. The tool is next withdrawn and the carriage released from its position.

The turret tool holder is now swung around and the undercutting tools are brought into position to accomplish their part. The undercutting tools are held rigidly in their holders, the cross-slide is moved in against a stop and the car-

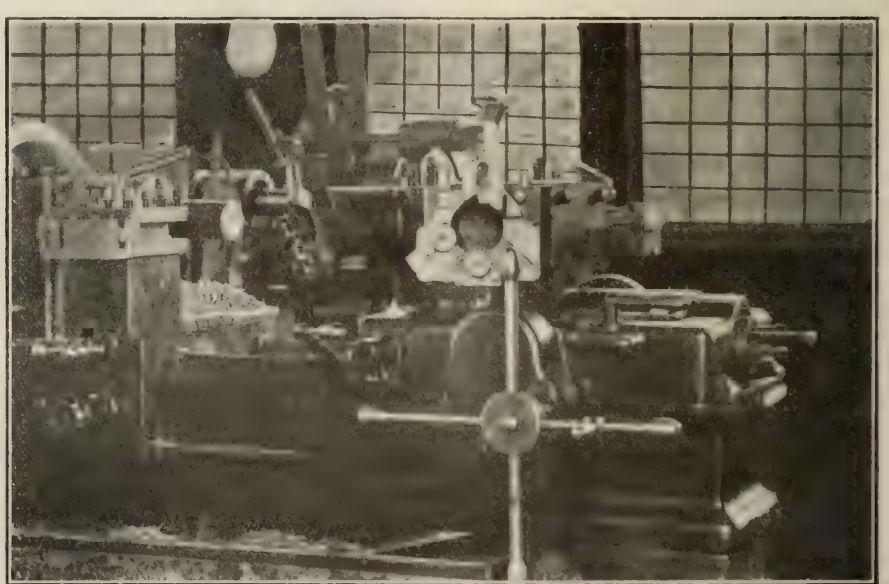

FIG. 7. ROUGH TURNING AND CUTTING RIFLING BAND RECESS ON AN 18-PDR. SHRAPNEL SHELL IN A WARNER & SWASEY TURRET LATHE.

riage is released from its locked position, being moved toward the face plate against a stop. The cutting edge of the tool is so ground that it meanwhile has accomplished the undercutting. Similarly, the carriage is moved toward the tailstock of the lathe against a stop, and at the same time the little undercutting tool has accomplished the undercutting at the other edge of the groove. This completes the operations on the groove. There are three lathes similarly tooled to accomplish this operation; these are R. K. LeBlond engine lathe, and two Canada Machinery Corporation engine lathes. Limit gauges are used to determine the finished size of the groove. Small steel gauges are also used to test the width of the groove and also the undercutting.

### Boring the Shells.

The large portion of the boring is done on turret lathes, but there is one MacGregor Gourlay engine lathe fitted up with some extremely interesting tools. A massive special cross slide is made to

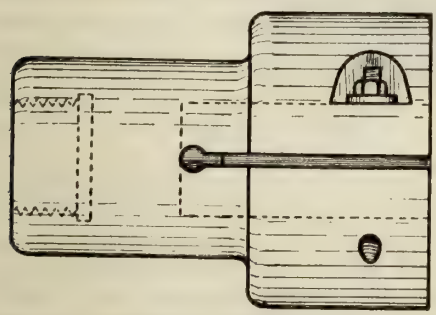

FIG. 10. CHUCK FOR BORING AND FINISHING INSIDE OF NOSE OF 18-PDR. SHELL.

fit on the carriage. Two boring bars are fitted into this special cross slide as is seen in Fig. 9. The near boring bar carries the rough cutters for rough boring the powder pocket and the diaphragm seat. Soda water cutting lubricant is used and is carried to the cutters through a rubber hose connection from the soda water pipe. This hose carries the lubricant to the boring bar whence it passes through a duct in the bar to the tools. The tool is fed into the shell and, as the roughing depth is almost reached, a turning tool, carried on a fixture bolted to the cross slide, rough turns the outside of the shell for a short distance from the nose. This part of the shell has not as yet been machined.

Just as the carriage is about to come up against its stop, a second tool, carried on the fixture bolted to the cross slide, faces the end of the shell. The carriage travels up against its stop and the operation is completed. Two locating stops are used to locate the cross slide to centre the two boring bars. After the roughing bar has been put down in the shell, the boring bar carrying the finishing cutters is entered. The hose connection is transferred to the finishing bar, the water being meanwhile turned off at the end of the pipe main. The bar is then fed into the work and the carriage is travelled up against its stop which indicates that the tool has been fed in to the correct depth. The operation is thus completed. The tools are placed in the bars in a horizontal position and each has two cutting edges. The shell is placed in a simple chuck up against a stop and as clearly seen in Fig. 9, this chuck consists of a casting bored out to receive the shell and then split. Two studs are screwed into the one half and nuts on the other ends of the stud cause the two pieces of the split casting to close in, firmly gripping the shell. Fig. 10 shows one of the various patterns of these chucks used in the boring operations and later when finishing the inside of the nose.

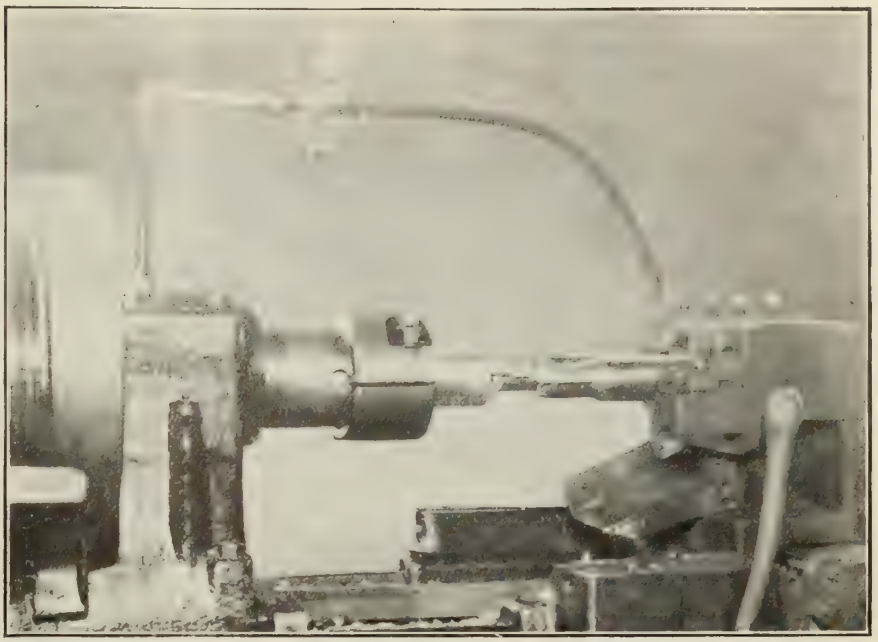

FIG. 9. BORING 18 I DR. SHRAPNEL SHELLS ON A MACGREGOR-GOURLAY ENGINE LATHE.

Another type of machine fitted up to do this work is a Lodge & Shipley turret lathe. This lathe is equipped with a chuck similar to that shown in Fig. 10, as will be seen by referring to Fig. 11. The tooling is entirely on the turret. There are two bars and these are equipped in a similar manner to those just described in connection with the MacGregor-Gourlay lathe. In the chuck,

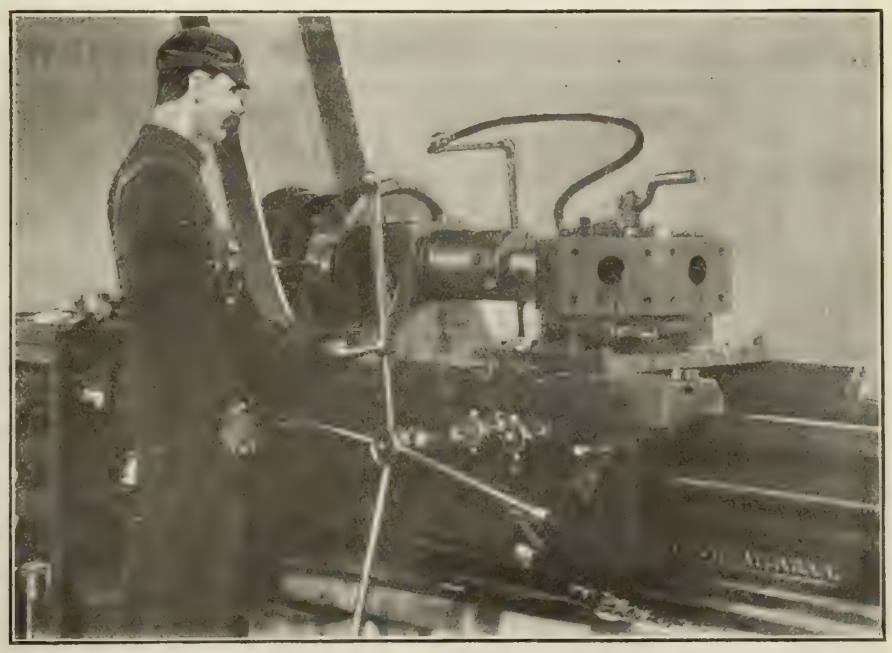

FIG. 11. BORING 18-PDR. SHRAPNEL SHELLS ON A LODGE & SHIPLEY TURRET LATHE.

however, a set screw has been placed to grip the shell more firmly. Water is also supplied to the cutters by a length of rubber hose as in the case described previously. Other than the fact that the tools are on the turret, the tooling on the two machines is identical.

It will be noted that in the case of the Gisholt lathe rough turning, there was no tool on the turret tool holder to rough turn and form the taper on the nose. This operation is done on a Warner & Swasey turret lathe tooled up for boring. The operations just described constitute the roughing operations.

### Test Gauges.

A large number of shells are machined in adjacent shops up to this point, and here enter the shop and pass a rigid inspection. The size and form of the powder pocket is tested with a limit plug gauge turned to the proper profile of the powder pocket, while a similar limit plug gauge is used to test the diaphragm seat. The depth of the disc seat above the bottom of the powder pocket is tested, also the thickness of metal in the bottom of the shell, and also the over-all length. Limit gauges are used to test the diameter of the recess, also the diameter over the wave lines. Also the finished diameter of the back of the shell is tested. The gauges used, are all standard, made from the sample set supplied by the Shell Committee. It has been found that in practical manufacturing the limits allowed in size are far more liberal than the limits allowed in weight, and the manufacturer finds that the close regulation of weight rather controls the limits in size. Thus experience teaches him that his limit gauges must be made to allow of a smaller variation than the official drawings. The shells received from the outside shops having undergone the same rigid inspection as the others, all pass on to the heat treating department.

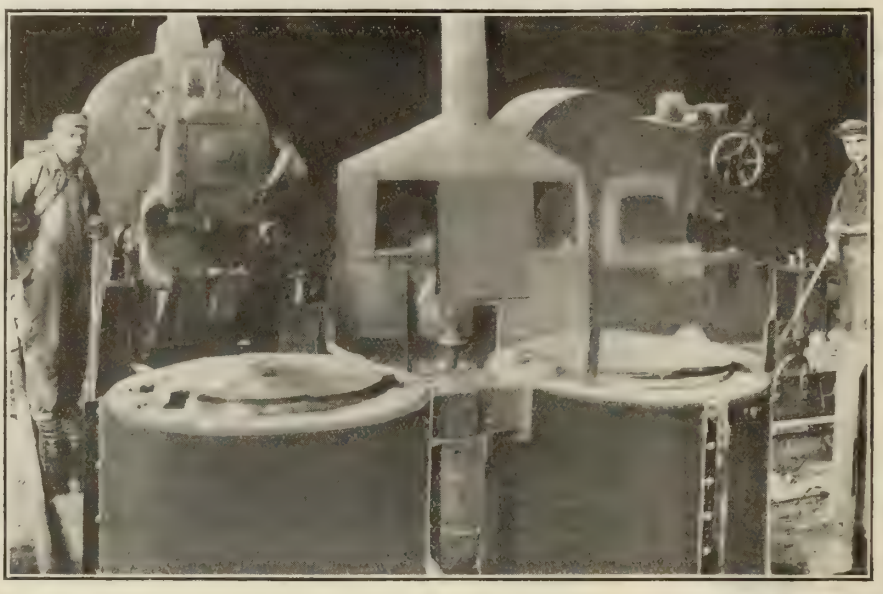

FIG. 12. TWIN LEAD POTS IN CENTRE BACKGROUND. C.M.C. AND BERTRAM PUNCHES, TO RIGHT AND LEFT RESPECTIVELY, UTILIZED AS NOSING PRESSES. ANNEALING FURNACES IN FOREGROUND.

### Heat Treating and Nosing.

Two oil furnaces and two oil quenching tanks are used in connection with the hardening. The furnaces and tanks were made in the works. The former are each equipped with Bristol pyrometers. Twenty-four shells are placed in each furnace at a time and are allowed to remain there for thirty minutes at a temperature of 1,550 degs. F. They are then taken out and placed in baskets made from small flat bars of wrought iron and steel, being afterwards lifted in an air hoist and carried over into the tanks of seal oil and quenched. In the bottom of the tanks cold water coils are placed, and the circulation of the cold water in these pipes tends to absorb the heat from the seal oil and keep it in the neighborhood of 60 degs. F. When thoroughly quenched, the shells are hoisted out of the oil tanks in the baskets and thoroughly washed in hot soda water. They then pass on to one of the six annealing furnaces which takes care of

FIG. 13. HARDENING FURNACES AND OIL-QUENCHING TANKS IN REAR. ANNEALING FURNACES IN THE RIGHT FORE GROUND, AND SAND BLAST APPARATUS IN THE LEFT FOREGROUND.

eight shells in a batch or service lot.

The shells in these annealing furnaces are heated up to a temperature of 800 degs. F., and kept there at that temperature for half an hour. Bristol pyrometers are installed to record the temperatures in the muffles of the furnaces. All of the six are oil type and were built in the works. The shells are allowed to cool in the air, and are then taken to the nosing presses. The noses of the shells are placed in a lead pot and heated to 1,400 degs. F., previous to being closed in. The lead is kept hot by means of an oil furnace, which was also built in the works. Two lead pots are placed beside each other, the heat and gases being carried away in pipes. The top of the molten lead is covered with charcoal for a triple reason — to prevent excessive radiation of heat from, and oxidation of, the metal, and to prevent the lead from adhering to the steel shell. Projecting out of the lead are rods over which the shells are placed with their noses immersed in the molten lead.

On either side of the lead pots are situated two punches, one a John Bertram & Sons' product, and the other a Canada Machinery Corporation product, both equipped with dies to nose the shells. The latter are taken from the lead pot, the steel disc placed inside, and the nose bottled in the punch. Fig. 12 shows the lead pots and these nosing presses. The noses of the shells are again placed in the lead pots for from twenty to thirty seconds to anneal them, as the thickness of the nose upon being bottled-in, is not great and the cold dies are bound to chill them somewhat. Thus, to facilitate the finishing of the noses, this procedure of semi-annealing is practised. The noses are allowed to cool in the air afterwards.

**Sand Blasting, Hardness Test, Etc.**

The shells next pass to the sand blast where the recess is cleaned up and the

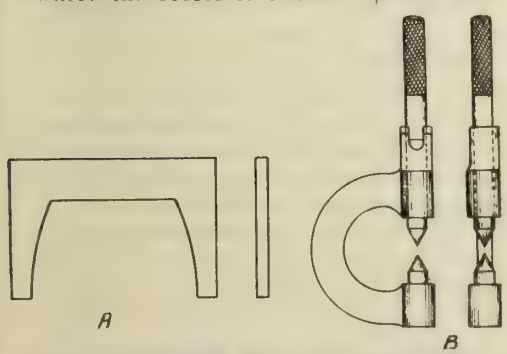

FIG. 15. GAUGES USED TO TEST SHELL AFTER FINISHING INSIDE OF NOSE.

back of the body is polished. Fig. 13 shows the hardening furnaces, the oil tanks, the electric hoists above them, the annealing furnaces and two of the three sand blast outfits. From the sand blast the shells are taken over to the hardness testing department. Here a couple of spots on opposite sides of the shells about three inches from the back end, are cleaned up on buffing wheels. The shell is then passed under the Shore scleroscope to have its hardness tested. The finish machine operations follow.

**Finishing Inside of Nose.**

Several lathes are equipped for performing the finishing operations on the nose, all of these being equipped with cast iron chucks similar to those described in connection with the boring operations. Apparently there are three patterns from which the bodies of these chucks have been cast, but the principle of them all is identical. Fig. 14 shows the first lathe, a Smith & Coventry turret lathe tooled up to finish the nose. All the tools are here placed on the turret of the machine. The first tool to enter the work is an ordinary boring tool carried on a boring bar. This tool rough bores the nose. A finish boring tool with two cutting edges is carried on the same bar as also is a tool for facing the end of the shell. The turret is traveled toward the head-stock of the lathe and these two tools come into the work. A cast iron stop in front of which is placed a V-block on the ways of the machine acts as a stop for the turret carriage. As the shell is chucked against a stop this tooling finish faces the shell to length. The boring bar is withdrawn and the turret swung.

The next bar carries a wide cutting tool, the cutting edge of which has been ground to roughly turn and form the nose. A stop on the lathe indicates when the proper amount of metal has been removed. At A, in Fig. 15, the gauge for testing the diameter and contour of the nose of the shell is shown. The turret is swung again, and a similar tool carried on a short rigid bar is now swung into position. This tool is to finish turn and form the inside contour of the nose. Then the turret is swung, and a collapsible tap is used to cut the thread on the inside of the nose. The thickness of the metal in the nose is tested with the gauge shown at B, in Fig. 15.

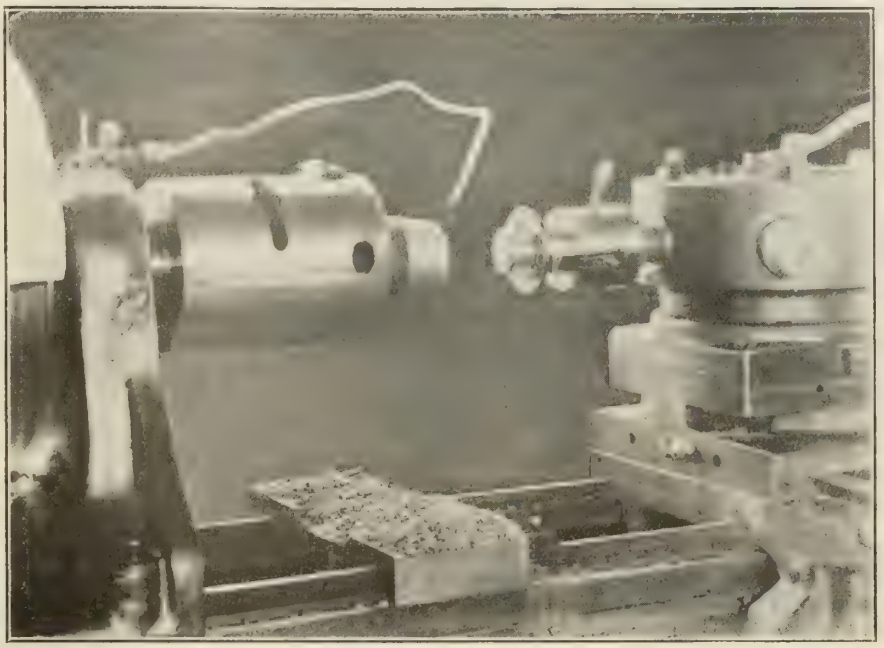

FIG. 14. FINISHING INSIDE OF NOSE OF 18 PDR. SHRAPNEL SHELL ON A SMITH & COVENTRY ENGINE LATHE.

This completes the series of operations on this machine. There are also two MacGregor, Gourlay turret lathes somewhat similarly tooled, the only difference in the tooling being that the turret carries a solid straight fluted reamer on a boring bar, which reamer is put through the nose before the collapsible tap.

A fourth machine on which these operations are done is a Warner & Swasey turret lathe. The turret of this lathe is of rather too light construction to withstand the heavy cutting of the turning and forming operations of the inside and outside of the nose. Thus, on this lathe these tools are carried on a special turret tool holder mounted on the cross slide. Two boring bars are attached to the turret. The first of these bars carries the rough boring tool, the two-edge cutter finish boring tool, and end facing tool. The second bar carries the collapsible tap.

**Finish Grinding.**

The next operation on the shell is the finishing of the outside of the bodies. This is done in either of two ways in this plant. The first way is to grind the bodies to size, and the second is to turn them on engine lathes. There are two Norton grinders, one fitted with a stone to finish the bodies, and the other to

finish the noses. There are also two Landis machines, one to finish the bodies and the other to finish the noses. Before she shell can be ground, it has to be supplied with centres.

The shell is placed in the grinding machine with the nose end towards the head-stock of the machine. The square end of the plug centre in the nose fits into a slotted fixture on the live spindle of the machine and the shell is thus driven. The nose end of the shell is usually ground before the body. A wheel is used, the face of which has been dressed to the proper curve to form correctly the nose. The stone is frequently dressed to ensure accuracy. The diameter and profile of the nose is tested by gauge. The bodies of the shells are ground on a flat wheel of six inches face. This wheel is not traversed across the work. Fig 17 shows the Norton grinder with a shell in it having its body finished. The Landis machines are equipped with wheels similar to those used on the Norton machines. Owing to the hardening department having pretty thoroughly mastered their problems, not much difficulty is being experienced with the grinding.

### Finish Turning.

A large number of shells are being finish turned. For this operation, the shells have also to be equipped with centres. On some machines the same centres are being used as are used for grinding. On other lathes, however, the centre shown in Fig. 18 is placed on the back end. The shell is placed with its nose to the face plate and the square end of the plug centre in the nose fits into the fixture shown in Fig. 19, which is bolted to the face plate of the lathe.

In each case the cross slide feed has been disconnected. At the back of the machine, a piece of flat tool steel has been bolted. One edge of this flat piece of steel has been ground to the exact contour of the shell and hardened. Heavy weights suspended on wire ropes attached to the cross slide, keep a fixture which has a hardened steel guide point and is bolted to the cross slide, pressing firmly against the formed edge of the hardened steel gauge. Adjustments of the compound rest, with which all these lathes are equipped, feed the tool into the work. The carriage is traveled by power and the cross slide is guided by the template. Thus the body is turned and the nose turned and formed.

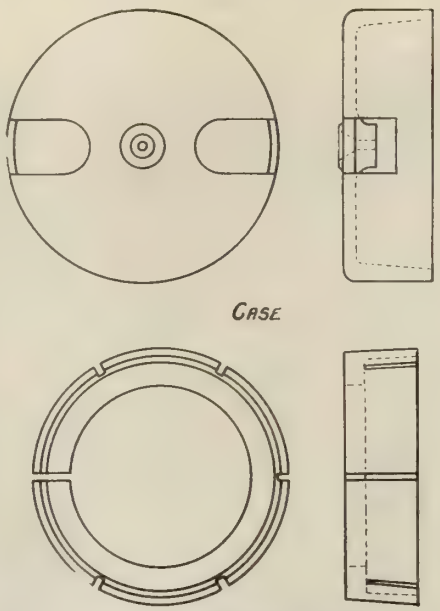

FIG. 18. CENTRE USED FOR TURNING.

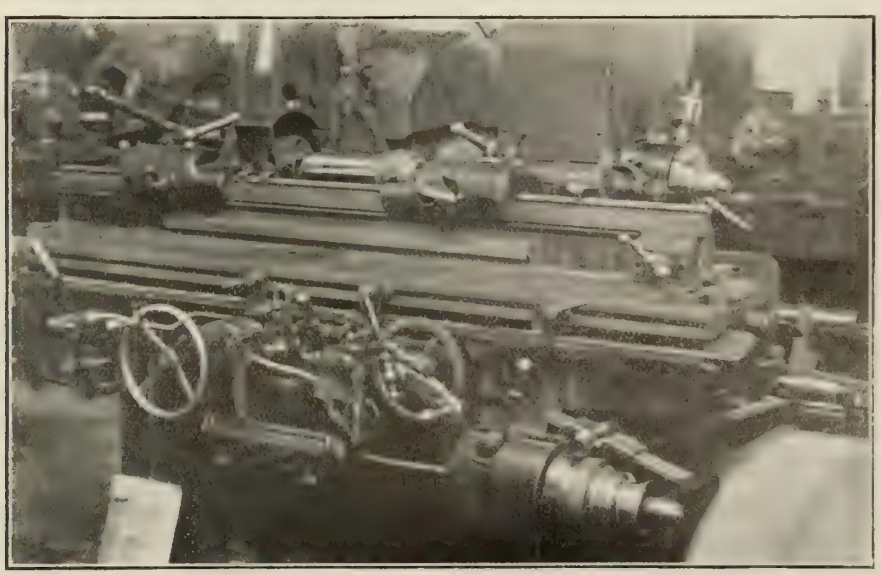

FIG. 17. GRINDING BODIES OF 18-PDR. SHRAPNEL SHELLS ON A "NORTON" GRINDER.

Twelve engine lathes altogether are engaged on finish turning. As soon as the shells are turned, the centres are removed, then three "nicks" made with a cold chisel, are given the wave lines. This, it has been found, allows the air to escape from between the wave lines when the copper bands are pressed into the grooves, and thus they are better able to fulfil their functions. The shells are marked on a Dwight slate stamping machine and then pass on to the preliminary Government inspection because at this stage the complete operations on the body of the steel shell have been finished.

### Applying and Turning Copper Bands.

After the shells are received from the preliminary Government inspection, they are taken to the banding presses. Here the bands are slipped over the ends of the shells and a hammer blow, elongates them sufficiently to keep them in the recess. They are then placed in a Lymburner press. Two applications of the jaws are sufficient to squeeze the band home for keeps. The shell is given a slight twist between the first and second application of the jaws.

There are six lathes in all engaged in band turning, these include one Warney & Swasey, and one Acme, which are turrets; one Canada Machinery Corporation, one R. McDougall, and two MacGregor, Gourlay engine lathes fitted up for the work. All are equipped with collet chucks into which the shells are placed up against a stop. On the turret lathes an overhead roughing tool takes a roughing cut from the copper band; then the turret is swung and a revolving centre is brought to support the back end of the shell. The finish cutter is fed in from the cross slide and the cutting edge of this tool is so ground that the finished contour of the copper bands is formed. Limit ring gauges are provided to test the work. The engine lathes are also equipped with collect chucks. No support is given the outer end of the lathe as the shell body is grasped well up in the chuck. The shell in each case is placed up against a stop in the chuck.

Both the roughing cutter and the finish cutter are carried on the cross slide as may be seen by referring to Fig. 20, which shows a MacGregor, Gourlay lathe tooled up to turn the copper bands. The roughing tool approaches the work from the back, while the finishing cutter which is very solidly clamped to a special tool holder approaches the work from the front. The carriage is placed against a locating stop when the finish turning is being done. All the engine lathes doing this work are very similarly equipped. The shell now passes on to the assembling department.

### Assembling.

As soon as the shell arrives at the assembling department, the little powder cup is placed in the shell and with a

quick manipulation of the hand at which the men become very expert, the cup is placed below the steel disc or diaphragm. The brass powder tube is then screwed in the disc and the disc seated firmly. A funnel is now placed over the mouth of the shell. A central rod attached to the funnel performs a double duty as it slips into the powder tube, for it not only centres it but keeps shot and other material from getting into the tube. The shell is now placed on a vibrator and the shot put in from a self-measuring device. This automatic device is of course only approximately correct and it is not relied upon to determine the exact number of shot. As soon as the shot have all seated down into the body of the shell and are firmly packed there by the action of the vibrator, the shell is put under one of the resin pots and filled with molten resin. To keep the resin from getting into the brass powder tubes, small wooden plugs are placed in the tube by hand, and these remain there while the resin is being poured.

The shell is now carefully weighed on a delicate balance, and, if it be light, one or two shot are added to make up

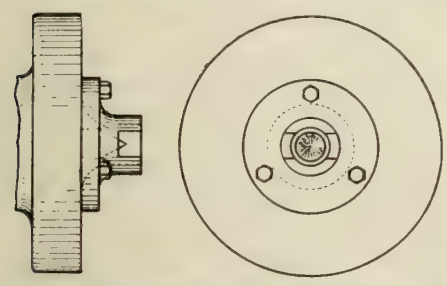

FIG. 19. DRIVER FOR TURNING SHELL BOLTED TO FACEPLATE.

the weight. On the other hand if it be heavy, a shot or two are removed. The shell is next clamped in a vise and the brass socket screwed into the nose. The brass threads are coated with red lead cut in oil previous to being screwed in the noses. Pipe tongs are used to screw the sockets home solidly. The shells now pass in to the soldering operation. The powder tube extends through the central hole of the socket when the socket is screwed down, and the powder tube is soldered to the socket by a specially constructed soldering iron. After this operation, the shell is ready to pass on to the brass turning lathes where the sockets are finished.

### Finishing the Brass Sockets.

Altogether, there are eight small turret lathes fitted up for the machining of the brass sockets. Although products of three different factories, namely the John Bertram & Sons, Dundas; Smith & Coventry, Manchester, England; and the Warner & Swasey Machine Tool Co., Cleveland, Ohio, the lathes are all similarly designed, and their tooling very similar. Fig. 21 shows one of the Smith & Coventry lathes tooled up for the work. It will be noted that the shell is held in a special two-jaw chuck and a steady rest. The two jaws of the chuck are self-centreing and the shell fits up against a shoulder in the jaws. The steady rest is the standard type of rest in every respect except that the jaws are of bronze.

The first tool on the turret is the rough turning and forming tool which is fed longitudinally into the work. The next tool is the finish turning and forming tool which is fed slowly into the work with the lathe also revolving slowly. In both these operations, the carriage is fed up to a stop. The next tool turns down the socket for a short distance, it also being fed into the work longitudinally. The projecting end of the powder tube is now trimmed. A scraper rest is next brought into position, and the bottom of the socket and the end of the tube are touched with the scraper as is also the outside diameter. Sometimes the outside diameter is also touched with a file. With the completion of this operation the machining of the shell is finished. In passing a rigid shop inspection, finish taps are run into the socket and a finish tap is also run into the grub screw hole; the powder tube is cleaned out and reamed and the powder cup is cleaned out with compressed air. When these operations are completed the shell passes on to the final Government inspection, upon being returned from which the painting operation follows.

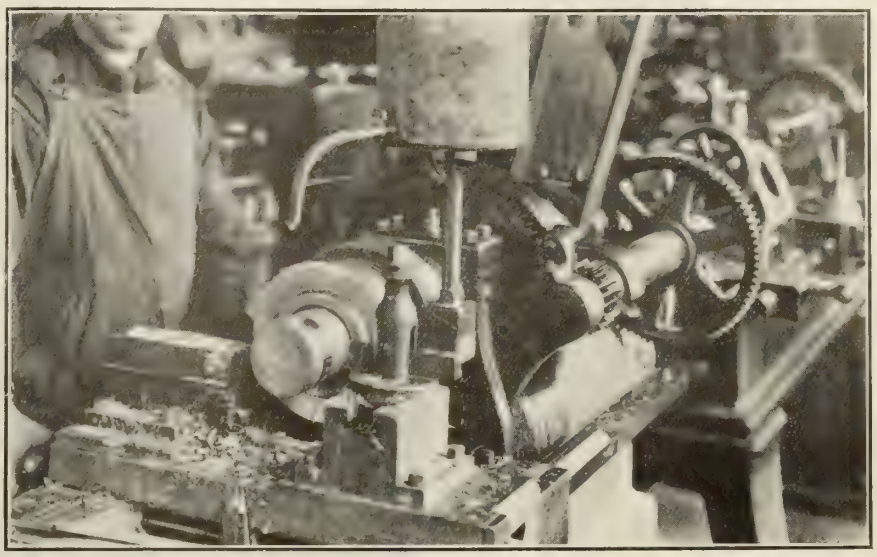

FIG. 20. TURNING COPPER BANDS ON A McGREGOR-GOURLAY ENGINE LATHE.

### Painting.

The first painting is to give the shell a coat of black Japan as a primer. This is done on a specially constructed painting table which is shown in Fig. 22. Three cups, into which the nose of the shells fit, project through the top of the table. Each one of these cups is attach-

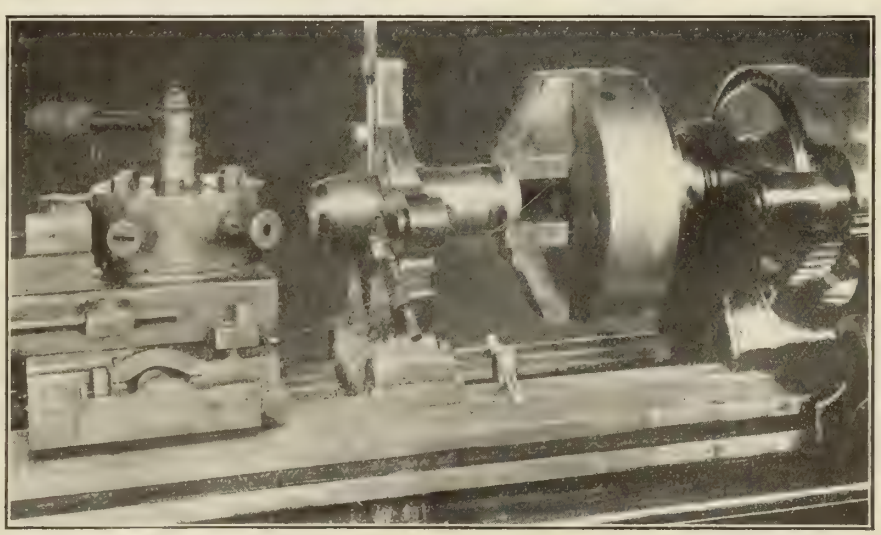

FIG. 21. TURNING BRASS SOCKETS ON A SMITH & COVENTRY BRASS TURNING TURRET LATHE.

ed to one of the little shafts which carry the gears of a train of spur gears, one gear of which is driven by a small electric motor, being belt connected to same. Thus, the little cups revolve, and when a shell is simply placed in the cups it stands vertically and revolves. Hence the application of the paint is a very simple matter. The brass socket which is not coated with black Japan is inside the retaining steel cup and the operator is in no danger of getting it smeared with paint: a large number of shells can be painted in a short time by a couple or three men. The finishing coat of a dark slate color is not done on this apparatus. The noses have to be painted with red lead.

It was found out when painting the finishing coat on this machine that the paint was inclined to run into the red leaded nose which made a messy appearance. Hence a horizontal apparatus has been devised. Before being finish painted, the little brass plugs are screwed in the sockets, and these keep all dirt out of the powder tube and cup, and at the same time protect the thread of the socket from injury. The brass plugs have a square hole in the head. A little motor driven lathe has been built, and the end of the live spindle has been slightly cupped out to receive the back end of the shell. On the tail-stock spindle, is a square centre which fits into the brass plug in the socket. The shell is simply placed in the revolving centre and the tail stock spindle screwed up, it not being necessary to stop the lathe to do so. Two pots of paint are carried on a shelf behind the lathe, and the paint brushes are tied by cord to the little bracket on the paint shelf. Thus the operator merely reaches out for the brush after he has put a shell in place. One man paints the body altogether, while a second man red leads the nose and assists on the body. The shells are afterwards taken out and placed on drying shelves where the back ends are painted. Packing in boxes of six and shipment follows.

### General.

The total production of the plant is about fifteen hundred finished shells per day, but it is expected that this number will be increased to two thousand a day very shortly. Three shifts of men per day are worked, each shift working eight hours straight. The remuneration is on a strictly piece-work basis.

All the tools are giving excellent satisfaction and all the departments are working well together. It is very remarkable indeed to think that less than a year ago this shell shop was known as the "Frog Shop" of the establishment. That such a different product could be manufactured in such quantities and in so short a time is indeed remarkable and too much credit cannot be given the plant engineering corps for their enterprise.

Chapman double ball bearing elevating trucks are much in evidence about the shop, while various types of platforms have also been constructed.

The artificial and natural lighting are both excellent, the ventilation of the shop is also good, and as a consequence

FIG. 22. PAINTING THE PRIMING COAT ON 18-PDR. SHRAPNEL SHELLS.

the output is secured under highly favorable conditions for both employer and employee.

## RELATIVE NUMBERS OF COMBATANTS.

A writer in the Fortnightly Review analyses British, French and German strength in men as follows:

| | Numbers before war. | Computed losses. | Numbers to-day. |
|---|---|---|---|
| Germany | 16,400,000 | 2,000,000 | 14,400,000 |
| U. Kingdom | 11,130,000 | 104,000 | 11,026,000 |
| France | 9,660,000 | 900,000 | 8,760,000 |

Deducting those lost to industry by present military service he arrives at the following table:

| | Germany. | U.K. | France. |
|---|---|---|---|
| Men between ages of 17 and 55, less by casualties deducted | 14,400,000 | 11,026,000 | 8,760,000 |
| Lost to industry by present military service (deduct) | 5,000,000 | 2,500,000 | 3,000,000 |
| Left for industry | 9,400,000 | 8,526,000 | 5,760,000 |

Extent to which countries can reduce their normal working population for the purposes of military service:

| | Germany. | U.K. | France. |
|---|---|---|---|
| Total number of males of military age | 14,400,000 | 11,030,000 | 8,760,000 |
| Number withdrawn from industry. | 5,000,000 | 2,500,000 | 3,000,000 |
| Number not yet withdrawn | 9,400,000 | 8,530,000 | 5,760,000 |
| Number normally employed in industries of the first necessity. | 8,200,000 | 5,260,000 | 4,400,000 |
| Number left available for other industries | 1,200,000 | 3,270,000 | 1,360,000 |

## SHELL WASTE UNAVOIDABLE.

LIEUT.-COL. BOISSONNET explains in the Temps some of the many reasons which make spendthrift artillery one of the necessary factors of victory:

The French "75" is a weapon of marvelous precision, but even with a new gun and the shells in perfect condition, after firing a great number of shots from a distance of 3,000 metres, the shells will be found to have fallen within a radius of ninety-six metres, and for one-half the radius will have fallen in a strip of about twenty-four metres. The gunner, therefore, has to regulate his fire so that the object aimed at will be in the centre of this most thickly covered strip, a task which against trenches, even after aeroplane reconnaissances, requires a considerable expenditure of ammunition. Again, when it is remembered that the trench itself is not much more than a yard or so wide, it will be realized that for every three or four shells which burst in the trench there are a vast number which explode before it or behind it.

### Waste Likely to Increase.

The need for heavy shell expenditure against trenches is already great, but it will become more urgent still after the siege period is over and real field fighting again becomes possible; when the artillery will have not the fixed target of the trench line but the thin mobile ranks of skirmishers as its objective.

Against moving infantry, unless it is advancing in close formation, regulated fire is a matter of some difficulty. Infantry which finds themselves between the first shell which has burst behind them and the short shell which has burst in front of them do not await the avalanche which is to follow, but rush rapidly forward beyond the first short shell, where they fling themselves to the ground under what cover they can find. The artillerymen know that they are somewhere in the neighborhood, and to begin again the tire de reglage would only be a loss of time, so that the only thing for the artillery to do is to shorten its range by 100 yards or so and to sweep with shrapnel the whole of the zone where they imagine the enemy's infantry to be.

A battery of "75" guns fires no less than eight shells a minute, and it is only with rapid, intense fire that the shrapnel fragments can sweep a whole countryside and break the enemy's attack. The same thing applies when the artillery is taking part in an offensive. They have to cover the whole zone of the enemy's front with a shower of shells, forcing the gunners to take shelter and pinning the infantry to the ground while their own troops are advancing to the attack.

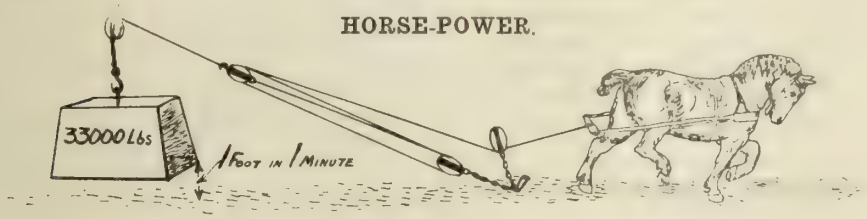
## FORCE, WORK AND POWER.

By A. F. White.

ALTHOUGH much has been written on this subject, and nearly every mechanical text-book and pocket diary clearly defines the term "Horse Power," perhaps the following description, with a few practical illustrations, may not come amiss to those who are not thoroughly conversant with the relation that exists between the terms—Force, Work and Power.



REPRESENTATION OF FORCE, WORK AND POWER.

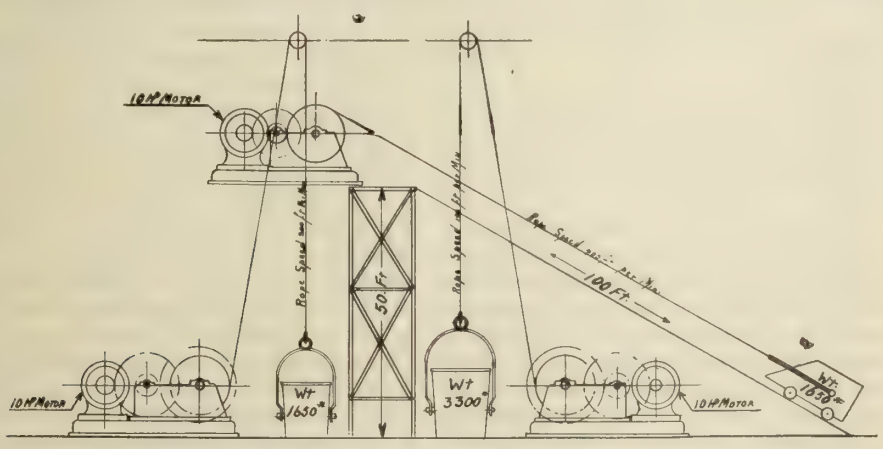
The writer, being connected with a company manufacturing haulage and hoisting engines, is often called upon to figure out simple problems regarding horse-power. A customer will sometimes write in, informing us that he has a load of, say 5,000 lb., which he requires to lift a distance of, say 200 feet. He invariably omits to mention at what speed this load has to be raised and expects us to quote on a machine of suitable capacity, and much time is often wasted in this way—writing in to obtain the necessary information. For the benefit of those who need a little rub up on the question, this article is written.

When the steam engine first came into use it was applied to doing work which had previously been done by horses, and it was estimated by James Watt that an average heavy-draft horse could do work continuously at an average rate of 33,000 foot pounds per minute. This was established as the standard horse-power, and has remained unchanged.

**Horse-power** is a combination of the three terms—"Force," "Work" and "Power."

**Force** is that which tends to produce motion. Steam exerts a force when it presses against the piston of an engine; also, a clock weight pulls on the cord and exerts a force on the works of a clock. These forces are expressed in pounds.

**Work** is produced by the exertion of force through space. A force is of no use for the production of power unless it can be made to move something. The pressure of steam against a piston does no work, produces no energy, until the piston commences to move; neither does a clock-weight do work when the clock is not running, although it pulls just as hard on the cord. Thus, a force may persist forever and cost nothing, but as soon as work begins to be done, energy is exerted and something begins to be used up, the force being expressed in pounds, and the space through which it acts in feet. The product which represents



FIGS. 1, 2, 3. ELECTRIC HOIST REPRESENTATIONS.

energy is expressed in foot-pounds. A foot-pound is called the unit of work, and is the work done when a resistance of one pound is overcome through a space of one foot. If a resistance of two pounds be overcome through a space of one foot, then twice as much work is done or two foot-pounds; also, one pound through a space of two feet represents two foot-pounds.

**Power.**—The power of a machine is a measure of the work which it is able to do in a given time. It is expressed in foot-pounds per minute, hour, or second, and is the product of the force and the space through which it is exerted, divided by the time occupied by the movement. It takes a larger machine to do a given amount of work in a short time than in a longer time; and a little pump will pump as much water as a larger pump if it is given time.

Raising 33,000 lb. through a height of one foot in one minute, or one pound through a height of 33,000 feet in the same time, equals 33,000 foot-pounds per minute, and is considered equivalent to one horse-power. Thus, 33,000 lb. raised 2 feet in one minute is 66,000 foot-pounds, and equivalent to 2 horse-power. In this way it can readily be understood that unless the element of time is considered, the power cannot be calculated. I will explain the foregoing with a few illustrations of practical applications of this rule.

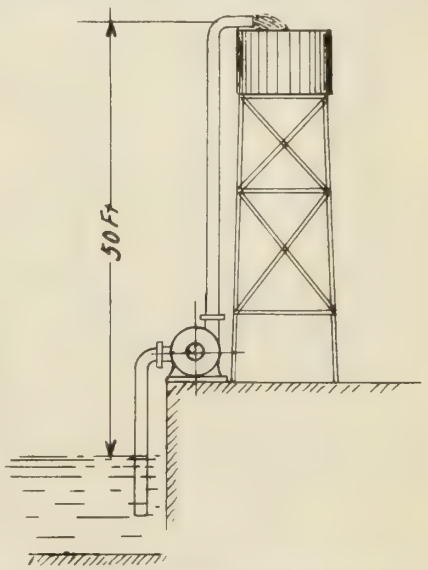


FIG. 4. FORCE, WORK AND POWER OF CENTRIFUGAL PUMP.

Figures 1, 2 and 3 represent an electric hoist such as often used by contractors; each hoist is fitted with a 10 h.p. motor, and performs the same amount of work in a somewhat different manner. In Fig. 1 the weight is 1,650 lb. and the estimated time to elevate same to the top of the platform which is 50 ft. high,

is 15 seconds, or ¼ of a minute, this being at the rate of 200 feet per minute. Then, 1,650 × 200 = 330,000 foot-pounds per minute, and the standard horse-power being 33,000 foot-pounds, we get $\frac{330,000}{33,000}$ = 10 horse-power.

Figure 2 illustrates a slow-speed hoist. The weight in this case is 3,300 lb., and the estimated time to elevate the load to the top of platform is a half-minute, which is 100 feet per minute, and half the speed of Fig. 1; so that 3,300×10 = 333,000 foot-pounds, which is the same amount of work done as Fig. 1, and 10 h.p. are used up in each case.

Figure 3 is another example, the height of the trestle being the same. The material and the bucket weight the same as in Fig. 1; also, the time taken to hoist is the same; therefore, the same amount of work is done, and the same power is required. In this case the incline is at an angle of 30° and the hypothenuse of a 30° triangle is twice the length of the side, so that the distance travelled will be 100 ft., and the time taken ¼ of a minute, being at the rate of 400 feet per minute. The pull on the rope at this incline will be ½ that of a vertical lift; then, $\frac{1650}{2}$ = 825 lb. = the load, including friction; then, 825 × 400 = 330,000 foot-pounds, or 10 h.p., as Figs. 1 and 2. This hoist is geared with twice the speed as in Fig. 1.

Figure 4 illustrates a centrifugal or turbine pump operating against a head of 50 ft., and pumping water at the rate of 660 Imperial gallons per minute. One Imperial gallon = 10 lb., then 660 × 10 = 6,600 lb., and this multiplied by the height in feet as in the former cases = 6,600 × 50 = 330,000 foot-pounds, or 10 h.p. Of course, in this case, friction, etc., has not been taken into consideration, and this varies considerably in pumps, and the efficiency may be anywhere from 40 per cent. to 70 per cent.

The foregoing may be considered very elementary by those who know, but it is for those who do not know that the article is written.

## USE OF SPINDLE GREASE CUPS.

By C. T. P.

SINCE the first spindle cup made its appearance, many styles and kinds have been used with more or less success. The original theory covering the spindle type of cup has, in many instances, been lost sight of, and the operation of the cup itself attributed to various make-shift theories which are without a sound basis. For instance, some advance the idea that the spindle resting on the shaft in a grease cup filled with a mineral or ordinary grease revolves, due to the rotation of the shaft, and in that way creates a disturbance in the midst of the grease in the cup, which causes the grease to flow and lubricate the bearing. This theory was never advanced on engineering experience. It is entirely unsound.

Others have advanced the idea that the spindle in a grease cup filled with a mineral or ordinary grease, works in a vertical direction through the grease and in that way is supposed to hop up and down in the cup and practically poke or push the grease to the bearing. This movement of the spindle is supposed to be produced by the action of the shaft which has some free-play in the bearing. This theory is also unsound.

The true theory or the principle upon which the spindle cup acts is a fundamental. The spindle type of cup should only be used with a solid lubricant possessing a low melting point. By this is meant a lubricant that will flow at a temperature ranging from 50° Fahr. to 175° Fahr. Never in any instance, use in any make, style or kind of spindle cup, a mineral or ordinary grease of higher melting point.

The spindle should be of soft copper, sheathed from the bottom to about half its length with a piece of corrugated copper. As copper is a good conductor of heat, the copper sheathed spindle, resting on the shaft, feels every fluctuation in bearing temperature. This, due to the high conductivity of the spindle, is readily impressed upon a low melting point grease or compound which flows, thereby reducing the bearing temperature to normal and then solidifying again. In this way practical, automatic lubrication is secured. The spindle vibrates but little, does not revolve and does not hop or jump in the grease cup.

## COMING CONVENTIONS.

**American Supply and Machinery Manufacturers' Association and National Supply and Machinery Dealers' Association, Hotel Bellevue-Stratford, Philadelphia, Pa. (Joint convention.)—June 3-5.**

**American Railway Master Mechanics' Association, Atlantic City, N.J.—June 9-11.**

**Railway Supply Manufacturers' Association. Convention and exhibit in conjunction with the Railway Master Mechanics and the Master Car Builders.—June 9-16.**

**Master Car Builders' Association, Atlantic City, N.J.—June 14-16.**

**American Society of Mechanical Engineers, Buffalo, N.Y. (Spring Meeting.)—June 22-26.**

**American Society for Testing Materials, Hotel Traymore, Atlantic City, N.J.—June 22-26.**

**American Foundrymen's Association, Atlantic City, N.J.—Sept. 27-Oct. 1.**

**Foundry and Machine Exhibition Co., Atlantic City, N.J.—Sept. 25-Oct. 2.**

## MANUFACTURERS PLAN TRADE EXTENSION.

THE Canadian Manufacturers' Association will hold its annual general meeting on June 8, 9 and 10 in the King Edward Hotel, Toronto. The sessions, it is announced, will be more informal than usual, entertainment features being considerably curtailed, in keeping with the spirit of the times.

On the opening day, matters somewhat outside the convention program proper will be dealt with. These will include a discussion of the "Made in Canada" campaign, the proposal to bring about a federation of safety associations under the Workmen's Compensation Act of Ontario, and the formation of an export trade association to improve Canada's strategical position abroad and to assist her in profiting by the exceptional business opportunities offering now. The second day will be devoted to the business of a regular annual meeting and the third for committee reports and the election of officers and amendments to by-laws. An informal dinner at 6.30 will close the proceedings.

## COPPER REFINING PLANT PROPOSED

THE establishment of a plant for copper refining will likely take place, following a conference on Saturday between the Minister of Militia, General Hughes, the chairman of the Shell Committee, Col. Bertram, Col. Carnegie, Dr. Wilson of the Department of Mines, Messrs. W. D. Matthews and Warren, of Toronto. It is intended to have every part of the shells which Canada is supplying made in Canada, and as far as possible of Canadian products. The smelting of copper in Canada is now considered feasible, and the plant will in all probability be located in New Ontario. Canada is now turning out 30,000 shells a day, and Canadian factories are making high explosives as well as shrapnel shells. A very large amount of Canadian lead has been used in the manufacture of munitions for the British army, the lead mines having contributed 50,000 tons of lead, shipped to England since the outbreak of the war.

# Arithmetic for the Machinist and Workshop Operative

By J. H. Rodgers

*It will be found by those who have follow ed the previous lessons and profited by them that the various practical applications can now be easily observed, applied and appreciated.*

## LEVERS.—II.

IN chart 51 are shown some practical applications of the simple lever. At A and B are shown two views of a lathe tool operating on a shaft. The arc (ab) shows the tendency of the tool to dig into the work, the tool swinging from the point (o) with a radius equal to (oa). From the position of the arc (ab), it would appear that it makes little difference just where the tool is situated, but, from a study of the lever diagram below each view, it will become quite clear that wherever conditions permit, the cutting point of the tool should be kept as close to the fulcrum or point (O) as possible.

Suppose that a pressure of 1,000 lbs. is exerted upon the screw of the tool post in both cases, and the length L and l in A are 3 inches and 3 inches respectively, and in B, 1 in. and 3 in. respectively, what resistance can be overcome at the cutting edge of tool?

$$\text{For A:—}W = \frac{PL}{l} = \frac{1000 \times 3}{3}$$

= 1,000 lbs.

$$\text{For B:—}W = \frac{PL}{l} = \frac{1000 \times 3}{1}$$

= 3,000 lbs.

The same principle applies to the use of the planer or shaper tool. This if not of sufficient strength to resist the action of the cut, will have a tendency to spring and revolve about the point (o), making the tool dig into the work as shown at (ab). If the tool be formed to bring the cutting point in a vertical line with the point (o) as shown by the dotted lines, this objection will be overcome as any excess pressure acting upon the tool will cause it to move away from the work. This is also true as regards the side thrust of the tool as shown at D. The tool if possible should be secured at right angles to the centre line of the shaft, and, to secure more stability, the tool can be fastened as shown, the contact points (a a) increasing its rigidity.

When motion is required to make a weight through considerable space, or the transmitting of power from one location to another, the simple lever must be transformed into a continuous lever composed of pulleys, gears, etc.

Chart 52 shows a pulley directly connected to a drum, upon which is wound a cable to raise the weight W.

This arrangement comprises the continuous use of the simple lever of the second order, the centre of the shaft representing the fulcrum, the radius of the drum equalling the weight arm, and the radius of the pulley equalling the power arm. A pull of 800 lbs. is exerted at P; what must the diameter of the drum be to raise a weight of 2,000 lbs., if the diameter of the pulley is 30 inches?

By formula:—$P \times D = W \times d$, or

$$d = \frac{P \times D}{W} = \frac{800 \times 30}{2000} = 12''$$

In the lower half of chart 52 is shown a sketch of a train of gears and pulleys which comprises the continuous applications of the compound lever. A weight W of 1½ tons is suspended from a cable running over a drum of 15 inches diameter; directly connected to the gear N, of 85 teeth, meshing with a pinion ($n_1$) of 35 teeth, which is directly connected to a gear N of 80 teeth, which meshes with a pinion (n) of 30 teeth, directly connected to a pulley of 36 inches dia.; what must be the pull upon the belt to raise the weight W, gears and pinions of 2 diametral pitch?

By formula we have:— $P \times D \times N \times N_1 = W \times d \times n_1 \times n$, or

$$P = \frac{W \times d \times n_1 \times n}{D \times N \times N_1}$$

$$= \frac{3000 \times 15 \times 35 \times 30}{36 \times 80 \times 85} = 193 \text{ lbs.}$$

By using the formula for compound levers in chart 49, we have :—

$$P = \frac{W \times l'' \times l' \times l''}{L'' \times L' \times L}$$

$$= \frac{3000 \times 7.5 \times 8.75 \times 7.5}{21.25 \times 20 \times 18} = 193 \text{ lbs.}$$

The diameters of the gears and pinions are found by dividing the number of teeth by the diametral pitch; and the length of the power or weight arms is the radius of the gears or pulleys.

What would be the speed of the belt in feet per minute in the above example, to raise the weight at the rate of 2 ft. a second?

2 ft. per second = 120 ft. per minute, and revs. per min. of drum

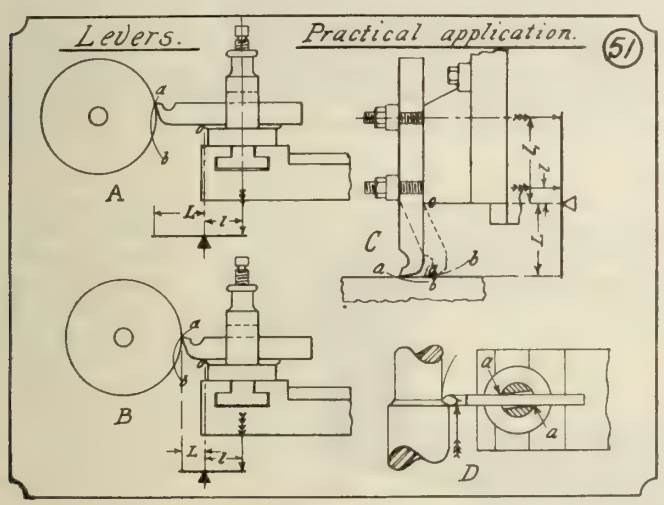
$$= \frac{120 \times 12}{15 \times 3.1416} = 30.56.$$

Revs. per min. of driving pulley.

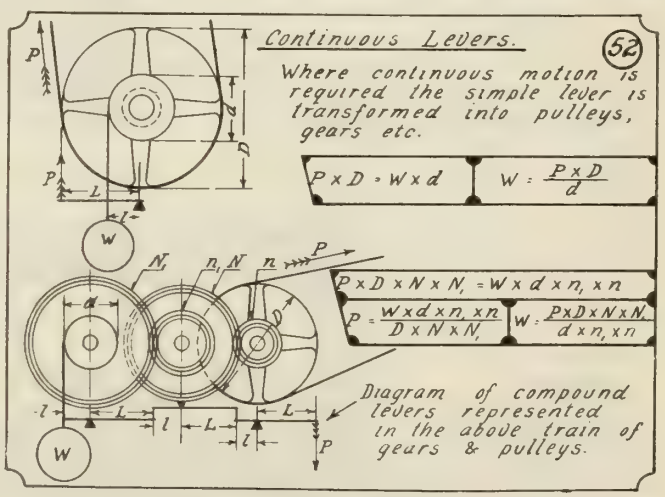
$$\frac{30.56 \times 85 \times 80}{35 \times 30} = 197.9 \text{ or } 198 \text{ r.p.m.}$$

Speed of belt

$$= \frac{36 \times 3.1416 \times 198}{12} = 1866 \text{ ft. per min.}$$



ARITHMETIC CHART 51.



Continuous Levers.
52
Where continuous motion is required the simple lever is transformed into pulleys, gears etc.
P x D = W x d
W = P x D / d
P x D x N x N1 = W x d x n1 x n
P = W x d x n1 x n / D x N x N1
W = P x D x N x N1 / d x n1 x n
Diagram of compound levers represented in the above train of gears & pulleys.

ARITHMETIC CHART 52.

## CONCERNING HIGH EXPLOSIVE SHELLS.

By H. A. W.

A CIRCUMSTANCE that will to some extent lessen the amount of idle time of many machine tools meantime intermittently employed on shrapnel, is to be found in the distribution of contracts for 3.3 and 4.5 high explosive shells. As regards the former, neither forging nor nosing are required, the black steel bars, about 3½ in. in diameter, being cut to approximate finished length, bored out parallel to required depth, internally threaded at nose, finish turned parallel outside for the greater part of shell length, form turned outside at nose, and recessed, threaded, and plugged for part of base thickness outside, etc.

For the most part, our machine shops with contracts for 3.3 high explosive shells, have not yet got past the experimental stage in the development of attachments to their standard equipment, or in the installation of new and special machines, but from what we have seen of the progress made, there is every indication that quite as much enterprise as that shown in handling the shrapnel problem will be finally evident. While fewer accessory parts constitute the 3.3 high explosive shell, the recessing and waving for the copper band, the pressing on and turning of the latter remain a necessary feature. Heat treatment is absent, but a varnish baking process for the shell interior may be reckoned to some extent as an equivalent.

### Sequence of Operations.

The approximate finished length black bars are first centred on drill presses, then rough turned on ordinary engine lathes, being turned straight or parallel without form template attachment. A second rough turning operation on turret lathes follows, after which the copper band recess and wave lines are formed. Drilling out the solid bar comes next, after which, on turret lathes, forming the nose, finish boring, and an internal recess or groove cut by a relief thread-cutting tool, constitute the feature operations. A three-thread chaser cuts the thread, after which the finish turning on engine lathes is accomplished with forming cams.

The base is next bored out to accommodate the base-plate, which is a forging, the idea for same and the necessary tapped counterbore being that bar stock is apt to have a "pipe" in it. The baseplate is faced off flush after being screwed home. The forging is a homogeneous piece of metal, strengthening the base, and preventing the tremendous firing pressure rupturing the base and igniting the high explosive in the shell, and thus destroying the gun and most probably killing the gun crew. Reinforcement is more than anything else, perhaps, the reason for the insertion of the baseplate.

The inside of the shell is next varnished or enamelled and dried in ovens, whose temperature is 800 deg. F., for a period of eight hours. Following this, the copper band is pressed on and turned, and cast iron plug screwed into the open end, thus completing the Canadian manufacture of 3.3 high explosive shells.

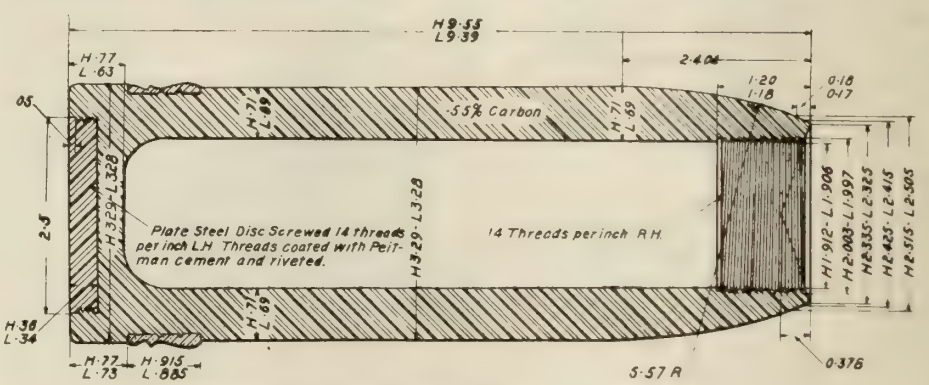
Heavy duty drills are, we understand, being requisitioned for the rough boring operation, and single spindle vertical drill presses operating high speed heavy twist drills are being tried out.

### 4.5 High Explosive Shells.

As to the 4.5 high explosive shells, contracts for machining large quantities of which have also been placed, practically nothing so far has been done either in the matter of experimenting or output. This particular projectile in its body element combines both size and weight in considerable measure, and although progress is meantime in abeyance, it may be assumed with considerable certainty that the shells will reach our machine shops as forgings instead of bar lengths as in the case of the 3.3 high explosive missile.

The 4.5 high explosive shell is nosed and corresponds in its machining to that of shrapnel. The nosing requires such an abnormal pressure, however, that the probability of steam hammers being requisitioned is great. This shell is bored all the way down and is also varnished.

Although none of our shops are yet equipped to handle them, heavy duty lathes rather than the lighter turrets are the meantime outlook.



BRITISH 18-POUNDER HIGH EXPLOSIVE SHELL.

### High Explosive Shell Output.

We expect that the output of high explosive shells, 3.3 and 4.5 will greatly exceed that of shrapnel, for the reasons that not only is there less detail to be cared for, but our plant staffs—administrative and operative, are now more expert, and therefore more confident.

The already recorded achievement of our engineering and metal working plants is, we make bold to say, in every-day peril of passing into the commonplace so far as shell output is concerned, and with every evidence of a long war and a steady demand for shrapnel and lyddite projectiles, it is highly probable that the achievement in which we meantime take a justifiable pride, will, six months or less hence, be scheduled as something quite mediocre.

## SASKATCHEWAN INDUSTRIAL DEVELOPMENT.

INDUSTRIAL growth in Saskatchewan, while not as great in 1914 as in 1913, was greater than in 1912. There were 228 factories inspected last year compared with 240 in 1913, and 225 in 1912. The 228 factories employed 3,004 men and 368 women in 1914 and in all 14,531 horse-power was used, of which 10,359 was steam, 3,794 electric and 378 gasoline power.

The flour milling industry has made the greatest showing with an actual increase of $1,158,530 in gross value of products in 1914 over the year previous. The average annual earnings of employees rose from $543 to $602.

The decline of industries allied to the building trades is explained by the fact that the value of buildings constructed in 1914 in seven cities of the province, was in round numbers, $4,000,000, as compared with $13,000,000 in 1913.

Iron foundries and machine shops have taken a place in the industrial life of the province, and are doing a steadily increasing business in the manufacture of structural and bridge steel, water and sewer pipes, castings and ornamental iron work. The board of highway commissioners have purchased several standard steel bridges from Saskatchewan factories, and have others on order.

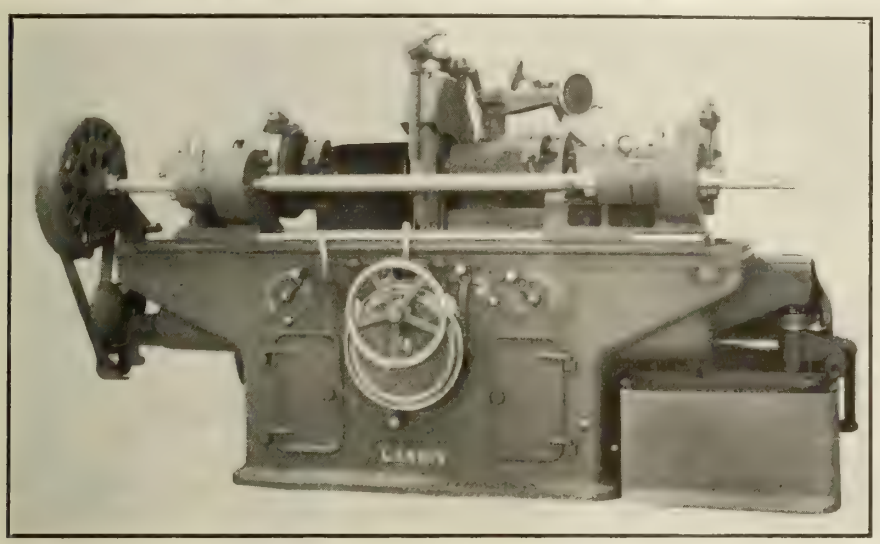
There were only two disputes between labor and capital during 1914, with 78 employees affected.

# PROGRESS IN NEW EQUIPMENT

## A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

### FIXED THROW CRANK GRINDER.

THE description and illustration refer to a new fixed throw crank grinder, the heads of which are designed for the rapid handling of crank shafts when grinding pins, no indexing of heads, or taking crank out of machine before it is finished, being necessary. The cranks are fixed in position by means of a locating pin which enters hole in flange on the crank. These holes, having been drilled central with the pins, are finally used when clamping flywheel to the crank shaft. The heads will accommodate both single and double throw cranks, and are particularly adapted for cranks having a flange.



LANDIS FIXED THROW GRINDER.

The throw on machine can be changed by having other crank carrying fixtures supplied, and these can be furnished to handle double-throw cranks up to 6 in. and single-throw cranks up to 8 in. When grinding double-throw cranks, it is only necessary to loosen clamping bolts in crank carrying fixtures and turn crank around to grind other throws.

The design of the heads allows the wheel to be worn down to a much smaller diameter than ordinarily. It will, of course, be understood that the wheel cannot entirely be used up grinding pins, but can be worn down to a much smaller diameter grinding line bearings. The Landis Tool Co., Waynesboro, Pa., are responsible for the design and manufacture of this particular specialty.

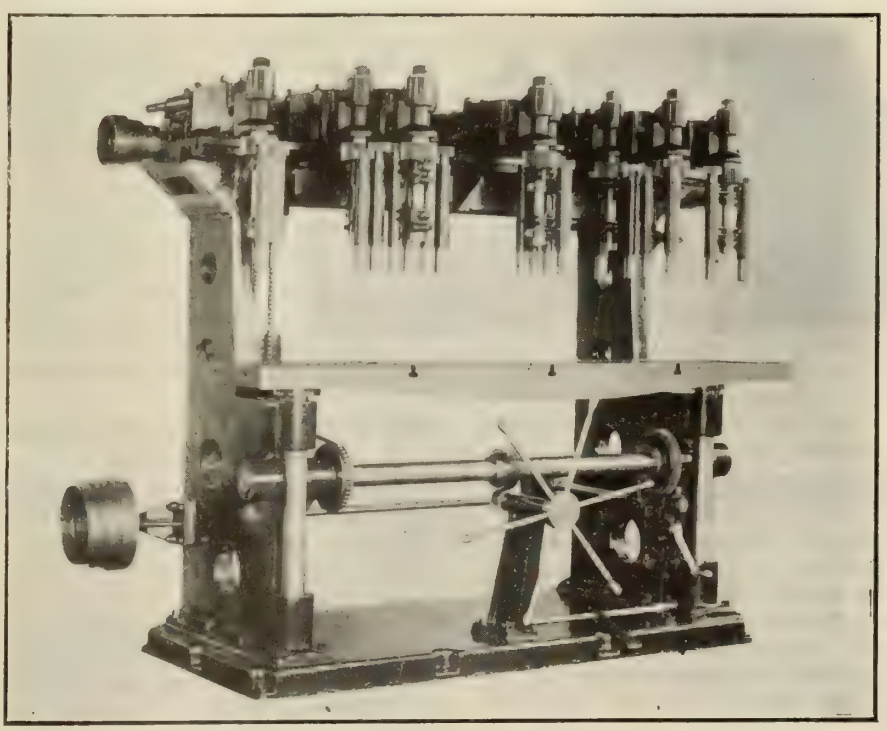
### ADJUSTABLE SPINDLE BORING MACHINE.

THE machine shown herewith is a product of the Reynolds Pattern & Machine Co., Moline, Ill., and is intended to meet a growing demand for a substantial tool for wood boring and light metal drilling. The spindles are adjustable so as to reach any point in a space of considerable width, and of a length only limited by that of the machine itself. In the accompanying illustration, this space is 14 in. wide by 6 ft. Any point in this area can be reached and practically any pattern of holes can be drilled on this surface, being limited only by the minimum distance between spindle centres, of 2 inches.

The constructional features consist of substantial housings carrying a rail of considerable horizontal width and having its face upward, and a continuous spiral in a semi-circular groove in this upper face meshes with a spiral gear in the drill heads. These drill heads are adjustable to any point along the rail and have a horizontal adjustment also across the rail.

The drill spindles are carried in brackets which can be adjusted to any point on a complete circle around a central stud carried in the end of the drill heads. The drill spindles are driven through a spur gear on the upper end, meshing with a gear of double the width on this central stud, which in turn is driven through bevel gears from the spiral meshing with the main spiral. The driving gear on the central stud is made double the width of the pinions on the drill spindles so that these pinions may overlap each other in order to bring the spindles close together.

The table feed is by rack and pinion, the racks being cut on the flattened side of the steel table supports. The pinions are cut integral on the heavy feed shaft which is driven through worm and gear from the cone pulley on the end of the main driving spiral. The table is counterbalanced and has a pilot wheel for hand feed. The feed trip is by drop worm knock-out. Table can be fed up by



ADJUSTABLE SPINDLE BORING MACHINE.

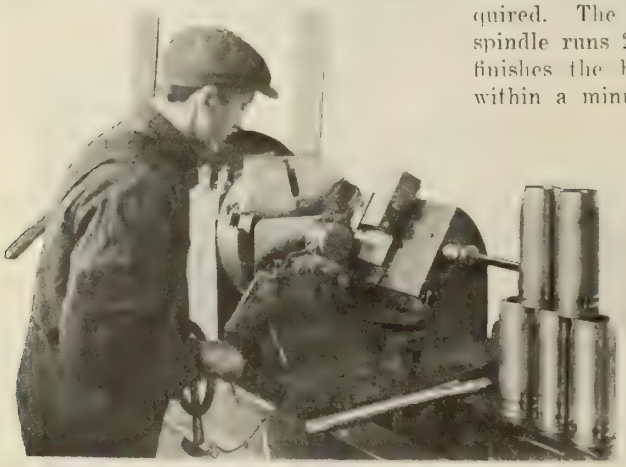
hand until the work strikes the bits, the power feed being then thrown in by means of the foot lever. Hand trip is provided so that feed can be stopped at any point.

By means of the adjustment of heads on rail longitudinally and transversely and of the circular adjustment of the spindle around the central stud, any point in the space covered by the spindle can be reached and almost any pattern of holes desired may be drilled. For instance, an unlimited number of holes may be drilled in a straight line not less than 2 in. apart. Four holes can be drilled in a straight line crossways with the table not less than 2 in. apart, nor more than 14 in. apart, outside to outside. Six holes can be drilled on a circle of 2 in. radius. While 2 in. is the closest centre distance with the regular adjustable heads, special heads can be made for much closer center distances.

Each machine is furnished with gear guards (not shown) and is also equipped with countershaft or arranged for direct motor drive.

## SHELL COPPER BAND TURNING LATHE.

IN connection with the manufacture of shrapnel and howitzer shells, the machine illustrated has recently been designed by Mr. Mills, chief engineer of the Jenckes Machine Co., Sherbrooke, Que., for turning the copper band on the shell after it has been put in place.

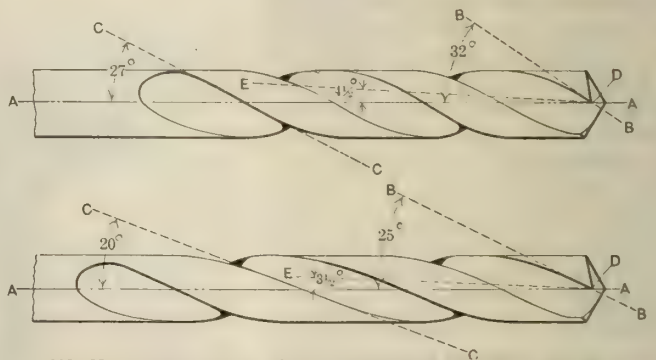


COPPER BAND TURNING LATHE FOR SHRAPNEL AND HOWITZER SHELLS.

Mr. Mills has, we understand, applied for a patent on this and other shell production equipment.

The bed of the machine is of the heavily ribbed flat top type, very substantial and mounted on standard legs. In place of the regular lathe headstock, two heavy copper bearings are used, each one secured to bed with four bolts. The caps are machine fitted and are held by four studs. The spindle is 6 in. diameter by 30 in. long, and is hollow turned all over and finished by grinding. The drive is through a 20 in. by 6½ in. clutch pulley, mounted on the spindle and bushed with bronze. The clutch is a hard maple cone of the full size of inside of pulley, and is operated by means of a lever extending from the far end of the spindle to within reach of the operator's left hand. The clutch mechanism is built into the spindle, and when in use has no tendency to move the latter endwise or cause end friction. Means are, however, provided for taking up end play of spindle should any wear occur. The chuck is a 15 in. three-jaw extra heavy geared scroll mechanism, and is bolted direct to the enlarged end of spindle. The tool slide base is extra heavy and is clamped immovably to the lathe bed.

The front or roughing tool is fed in by screw and hand-wheel to a dead stop and leaves a light cut for the finishing tool. The latter is mounted to the rear and above the work, and can be adjusted to pass down behind the shell, and, in passing, shave the band to size. The feed is by lever and pinion. The tools which can be removed for grinding and replaced with precision, are held in steel blocks by a clamp gripping their dovetailed portion, and are formed to shape of high-speed steel 4½ in. long. The shell is located by a swinging finger on front tool block before the chuck is tightened, and a hinged scraper rest is provided on front tool block for removing the ragged edge at each side of band after tooling. No countershaft is required. The belt is 6 double and the spindle runs 225 r.p.m. This equipment finishes the band on the 18-pdr. shell within a minute.



HIGH SPEED DRILL WITH GREATER TWIST ANGLE.

## HIGH SPEED DRILL WITH GREATER TWIST ANGLE.

IN this latest product of the Detroit Twist Drill Co., Fort street west, Detroit, Mich., the outstanding feature is that the angle of drill twist has been increased, from 25 deg. at the point and 20 deg. at the shank, to 32 deg. at the point and 27° toward the shank. The contrast between the old angle and the new one is shown in the accompanying illustration. The line AA in each case represents the centre line of the drill, the cutting point being at O. The line BB is tangent to the flute at the cutting edge, and CC is the tangent near the shank, GOE being the angle of the cutting edge, which is usually known as the clearance angle.

This angle has been placed by common practice at about 12 deg., although it is entirely in the hands of the man who does the grinding. The clearance is indicated by the line OE, drawn at right angles to the centre of the drill. If a line is drawn to the left of the line OE, so that at a distance of 3 in. from O it is inclined about 0.008 in. to the left, it will represent the ordinary feed of a drill, 1 in. in diameter. This represents the angle at which the cutting edge is advancing into the work, which it will be seen is inappreciable as compared with the clearance angle.

The greatest percentage of gain, due to the increased angular twist in this drill, it is emphasized, is found in the improved cutting conditions at the centre of the drill next the web, where the angle corresponding to the rake of a lathe or planing machine tool is only a fraction of that at the outside of the drill. This is indicated by the dotted line OE, which in the older type of drill makes an angle with the axis of the drill of only 3½ deg., while in the new drill it is 4½ deg., an increase of approximately 30 per cent.

The increased angle of twist increases the amount of metal removed in making the drill, which in turn increases the area for chips. The curved side of the flute is shaped so that it will deflect the chip readily and form it into a spiral, which will preserve its shape, thus enabling the drill to clear itself readily. Where cast iron is being machined, the chips will not coil and free themselves in this way, but the curve of the flute is relied upon to break up the cast-iron chip and thus enable it to be pushed to the top of the hole or easily blown out if an air blast be used.

With the increased angle of twist, greater chip space, and a longer life to the drill are claimed.

## ADJUSTABLE FOUNDRY CLAMP.

AN adjustable foundry clamp for use in place of clamping iron and wedges has been placed on the market recently by the National Clamp Co., 1657 Monadnock building, Chicago.

The constructional features consist of a jaw combined with a toothed rack along which a movable jaw slides, and this movable jaw carries a worm that is operated by a cold rolled steel handle. The worm has a heavy thread, a part of

ADJUSTABLE FOUNDRY CLAMP.

which is cut away to allow the movable jaw to slide freely along the rack. The remainder of the thread, when engaging the teeth of the rack, gives the clamping pressure. One turn of the handle causes a pressure movement of about $\frac{3}{4}$ of an inch.

In operation, the stationary jaw is placed under and the movable jaw on top of the flask, after which a short turn of the handle gives the pressure necessary to clamp tightly. The device is of malleable iron, and of simple construction, and the claim is made that flasks are fastened quickly with a straight downward pressure, eliminating shifting and jarring. The action of the worm on the rack is positive and when drawn tight, the clamp will not loosen even on a jar-ramming machine. Five sizes are manufactured.

## COMPRESSED AIR METER.

THE aim and purpose of this compressed air meter, which is a product of the New Jersey Meter Co., Plainfield, N.J., is to measure the air consumption of any machine or application of compressed air, and the actual net production of air by any pump or compressor within its capacity. The meters have only one moving element—which floats on air, and is consequently frictionless and non-wearing.

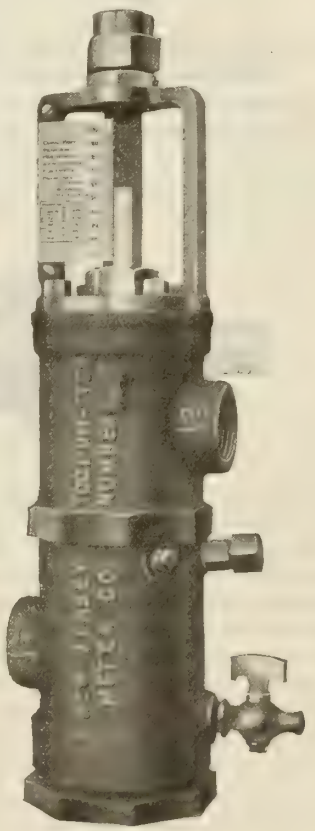
The principal on which these meters operate is the well-known law deduced by the French scientist Poncelet, which may be briefly stated as follows:—The volume of a definite compressed fluid or gas flowing under small constant head through multiple orifices of the same shape and size, is directly proportional to the number of orifices exposed to the flow.

The moving element consists of a weighted piston in the upper or metering cylinder, a small piston in the oil dashpot cylinder and a rod joining the two pistons and extending upward where it moves freely, without contact, inside the sight glass at the top of the meter. This rod rises and falls with the pistons so that its height in the sight glass corresponds exactly to the position of the piston in the metering cylinder. The scale plate mounted against the outside of the sight glass permits reading the exact height of the top end of the rod.

Air enters at the lower left-hand opening into the chamber surrounding the dashpot cylinder and passes through ported openings into the interior of the metering cylinder, the wall of which is drilled with a large number of small, accurately reamed holes uniformly spaced. To pass to the outlet chamber the air lifts the piston and exposes some of the holes to the flow.

A small "head," or difference of pressure, is established between the interior of the cylinder and the outlet chamber; this pressure difference, only a few ounces per square inch, being fixed by the exact weight of the moving element and the area of the piston on which the difference of pressure acts. The moving element rises until the weight is exactly supported by the difference in pressure. The pistons and rod are then floating in static balance in a position corresponding exactly to the volume of air flowing, the number of holes exposed and the height of the top of rod in sight glass. It is evident that the meter automatically adjusts itself to the conditions required by the principle or natural law stated above. The divisions of the scale plate are calibrated by comparison with a standardized instrument to read correctly.

It should be noted that this is not a velocity meter which would give readings

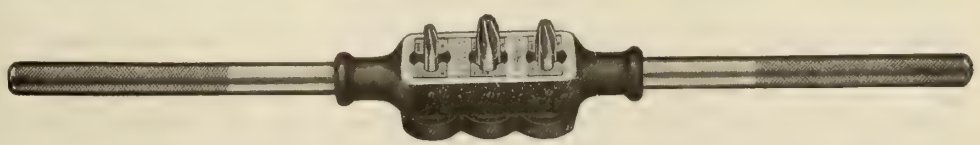


COMPRESSED AIR METER.

proportional to the square of the volume flowing, but is a direct volume gauge with a uniform scale on which one cubic foot is represented by the same distance whether working at low or high capacity. The loss of pressure is so slight that it can not be detected by a gauge and the meter can not be injured by a flow in excess of its metering capacity There are no leather pockets, rubber or leather discs, bearings, gears, valves or other parts which can develop defects to affect the accuracy; while the use of bronze parts prevents corrosion or rusting.

The Tool-om-eter (10 to 100 feet capacity, 1 in. openings) is designed to apply to small tools, such as chipping and rivet-

INTERNAL GUIDE WITH REAMER POINT



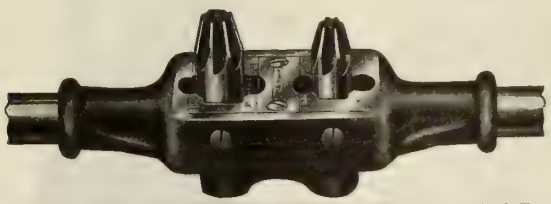
TRIO PIPE DIE STOCK WITH INTERNAL GUIDE.

ing hammers, plug, hammer and air-feed drills, wood boring and metal drilling machines, etc., rated by manufacturers at not over 60 feet per minute when new.

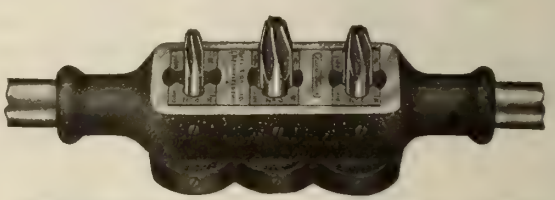
The Drill-om-meter (50 to 300 feet capacity, 2 in. openings) is adapted to mounted rock drills, coal punchers, diamond drills, sand blasts, air lifts, channelers, hoists, pumps, pile hammers, motors, etc., where the actual consumption is not over 300 feet per minute.

## NEW ATTACHMENT FOR PIPE-THREADING TOOLS.

THE Greenfield Tap and Die Corporation, Greenfield, Mass., have recently put upon the market a new attachment for pipe-threading tools, and known as an



DUO PIPE DIE STOCK WITH INTERNAL GUIDE.

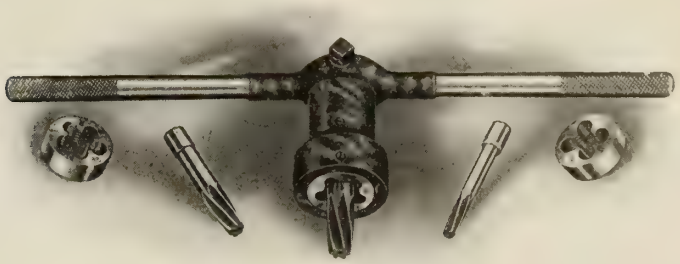


TRIO PIPE DIE STOCK WITH INTERNAL GUIDE.

Internal Guide with Reamer Point.

The internal guide takes the place of various forms of external or bushing guides which have been common heretofore for guiding the dies in pipe stocks for a straight thread. This new form of guide, as well as being effective in guiding the die in making its first threads, has the additional advantage of reaming the burrs from the inside of the pipe as it enters, thus doing two operations in one.

The guide is made in sizes to fit the



PIPE-THREADING SETS FOR CEILING WORK FITTED WITH INTERNAL GUIDE.

inside of the pipe to be threaded, and, working inside the latter, allows threading on a quite short projection. With pipes cut at an angle, no difficulties are said to be experienced, as the guide does not permit the die to tip and make a crooked start. The various illustrations show the application of the internal guide to various pipe threading tools manufactured by the G. T. & D. Corporation.

## HIGH-SPEED STEEL DEMAND.

A MOST striking feature of the munitions of war demand is the remarkable boom in high-speed steel. In the history of the trade nothing approaching the present demand for this specialty has heretofore been experienced; in fact, the present colossal requirements have never been dreamed of. Not only are orders numerous but they are of tremendous size and value. These orders, in addition to British sources, come from Russia, France, Italy and the United States. One order received recently in Sheffield, England, from Russia amounted to 100 tons. This does not seem a large quantity when speaking of steel to those familiar with the trade, but the importance of the order can be gauged by the fact that this material is quoted by the pound and the price to-day ranges from 41 to 97 cents, as against 32 to 85 cents in normal times.

In the manufacture of high-speed steel the principal alloys used are tungsten powder of ferro-tungsten, ferro-chrome and ferro-vandium, and the supply of these alloys has failed to a great extent, which has been a further handicap to manufacturers.

Prior to the war, it is estimated that Germany supplied 90 per cent. of the tungsten used by British manufacturers, and since then this source of supply has been entirely cut off. British firms are endeavoring to supply this deficiency and expect to be able to place their products on the market by midsummer, although there is no certainty as to this. In any case it is thought the present high prices prevailing will continue throughout the year.

Ferro-chrome (4 to 6 carbon) has advanced from 30 to 35 per cent.

The price of vanadium has remained stationary, owing to the fact that almost the entire supply comes from the United States, where there is ample production.

Ferro-tungsten has advanced from 57 cents to 97 cents per pound of tungsten contained in the alloy.

Tungsten powder (from 96 to 98 per cent.) has made the phenomenal advance from 57 cents to $1.34 per pound.

In former times tungsten powder was the favorite form of wolfram used by most manufacturers. Since then, however, owing probably to the difficulty experienced in procuring wolfram in this form, ferro-tungsten is being extensively used.

## FURNACE RECORD WITH DRY BLAST.

A NOTEWORTHY record was made in April by furnace B of the Steel Company of Canada plant at Hamilton, Ont. The furnace was operated with dry blast carrying an average of 0.826 grains of moisture per cubic foot, the average moisture in the atmosphere during the same period being 2.841 grains per cubic foot. The yield of ores for the month was as follows: For basic iron, 50.64 per cent.: for foundry iron, 51.55 per cent.:

| Day of Month. | Product, gross tons. | Average silicon. | Coke per ton, lb. |
|---|---|---|---|
| **Basic Iron.** | | | |

## THE SHRAPNEL SHELL MANUFACTURING SITUATION.

SINCE our previous writing, considerable progress has been made in the installation of shrapnel shell forging equipment, but whether all or any of this will make the comparison between forging capacity and machining capacity less odious, remains to be seen. More than commensurate progress and development we are disposed to affirm marks daily the latter feature, and leads us to suggest that contracts for shell forgings should be particularized more and the scope and opportunity enlarged.

In discussing the shell forging feature relative to equipment in a recent issue, we laid special stress on the fact that while much ingenuity had been displayed in formulating and applying attachments to standard lathes, etc., for machining purposes, no serious attempt had been made to "rig up" and maintain the equivalent in forging presses and furnaces. In a word, everybody wants to do the machining, and a most astonishing feature of the every-day development relative to it is to be found in a more or less general desire by individuals singly and jointly to seek to build and equip shell machining plants. Why, we ask, don't these people grip the undertaking at the 9 ft. x $3\frac{1}{2}$ in. steel bar, and either finish at the shell forging or at the trimming of the base and cutting-off to length of the open end of shell which constitute the first machine tool operations.

Irrespective altogether of the duration of the war, we seem to have no lack of already established and easy-to-be-equipped machine shops. Besides, and as already indicated, those latter are not standing still. All over the country, but more especially of course in Eastern territary, additions and extensions are being vigorously prosecuted and new machine tools being installed. Taking the situation therefore as we find it to-day, and more particularly of course in plants which have to be supplied with forgings, much of their equipment is perhaps 50 per cent. idle each week on account of shortage of the latter. What hope then is there for those who would promote the erection of shell machining plants which have to be created from the bottom up.

The disproportion between machining and forging capacities per day, named a few weeks ago—40,000 and 23,000 respectively, represents quite fairly how our established machine shops pure and simple stand relative to shell output. It seems to us that another half-dozen single or double installations of forging presses with their accessory equipment of saws and furnaces would not be found far amiss in relief of the present and yet to be developed machining situation, and until something of that nature materializes, it seems more or less needless to discuss, much less create, brand new machine shops.

## PREPARATION FOR HIGH EXPLOSIVE SHELL MANUFACTURE.

AMONG the many reasons patent and otherwise for the Imperial Cabinet shuffle now in process, lack of high explosive shells for our armies at the front appears to have more than ordinary prominence. Suffice it to say, however, that contracts for high explosive shells are being placed with our engineering and metal-working plants in number and extent as to presage much opportunity and much activity. In another section of this issue we have given in brief, racy outline a few facts relative to this new development in shell production.

It is quite apparent that for many operations on both 3.3 and 4.5 high explosive shells, new attachments, new and re-created equipment will be required, and along the lines indicated by the article referred to, more or less of a foundation may easily and safely be laid. As in the sphere of shrapnel shell manufacture, we, through the medium of our editorial columns, mean to neglect no opportunity and omit no instruction that will realize to our readers a full measure of knowledge of the very latest developments as these become available.

# The General Market Conditions and Tendencies

**This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.**

**Montreal, Que., May 24, 1915.**—Practically all the industrial activity throughout the iron and steel trade can be traced directly to the manufacture of shells and their component parts. It has long since been proven that these munitions of war can be very successfully manufactured in Canada, thus many other lines of business have been greatly stimulated.

The steel trade for instance has been benefited to a considerable extent. It is thought as the smaller shells have been so successfully turned out, that orders for larger shells will follow.

The machine tool business has never before been face to face with a similar situation. It seems that the historic words of Sir John French, "Shells and shells, then more shells," have not only been re-echoed, but have been transformed to become "Lathes, and lathes, then more lathes." Manufacturers of these specialties have been deluged with orders, business therefore is exceedingly brisk. Iron ore and pig iron are very quiet, foundries not running at more than one-quarter capacity, if running at all, in many cases. British pig is not being shipped.

In metals, a great deal of activity exists. The demand for metals in the manufacture of munitions of war has caused a great deal of fluctuation in prices. Other factors, as a matter of course, also contribute.

#### The Steel Market.

Although, for some time past, trade in

steel products has been fairly quiet, there seems of late to be renewed activities. Larger shells are being manufactured in Canada now and the smaller ones are being produced in tremendously larger quantities. The result is that a considerable tonnage of steel is daily cut up into billets to be forged into shells. There is, however, very little other local demand for steel. The building trade throughout the province seems to be at a standstill. Tool steel is being used in large quantities, there being a demand for it in bars and also made up into tools of various special and standard designs.

It would appear that this is a most opportune time for Canada to develop some foreign trade, were tonnage available to ship the material. South Africa, India, and Australia are in the market for large quantities of steel, but only a small quantity has been shipped to date because of the shipping difficulty. No doubt as time goes on these conditions will improve and some deals may be closed.

The railways of Canada have been buying much less steel than had been anticipated. This is due, no doubt, to there being so few trains operated because of the decrease in freight traffic.

### Pig Iron.

Pig iron remains at a standstill, and it is not likely that there will be any radical change in the situation as long as the war lasts. Prices also remain unchanged.

### Machine Tools.

As referred to above, the demand for machine tools has been practically unprecedented. It is to be noted in most cases that engine lathes of the heavy duty variety, are in great demand. Practically every lathe manufacturer in Canada and the United States is booked with orders for many months to come, while dealers are disposing of hundreds of second-hand machines, and others that have been rebuilt. Grinders for external work are also in more or less demand. Dealers are also stocking many jigs and attachments for equipping standard machines. Thus the volume of business moving is quite abnormal.

The supply business is excellent, belts, tool steel, waste, lard oil, cutting compounds, etc., being all in great demand. As the production of shells increases week by week, so also does this branch of the business increase.

### Metals.

With probably a score or more factors to influence it, the metal market is very changeable indeed. Shipping conditions and the demand, however, play an important role in the various changes. Copper during the last week has stiffened a little but no actual increase in price has occurred. The demand is good.

Tin has taken a further jump up of three cents a pound, while spelter has gone up one cent. The demand is increasing, yet there appears to be no immediate chance of importing these commodities.

Lead is rather quiet. It seems that the demand for this metal to be made into bullets, etc., has not in any way commenced to be as great as that in times of peace, which demand has, of course, been reduced to an extremely small amount.

Antimony, although scarce, has not risen in price. This is due to the small quantities being received from over the water.

The demand for aluminum seems ever on the increase, the price being now up to twenty-seven cents per pound.

---

**Toronto, Ont., May 25, 1915.**—There is no change to note in the general industrial situation. This has been a quiet week in business circles due to the political unrest in England and the strained situation between the United States and Germany. The crop outlook continues very favorable and is helping to relieve the depression. The trade returns for April recently published show a large increase in exports over the corresponding month of last year and a considerable decrease in imports. This reversal in trade has been caused by the extraordinary conditions created by the war and although exceedingly favorable, are at the same time abnormal. These conditions will no doubt prevail for some time as orders for large quantities of war material are still being placed with Canadian manufacturers, and it is probable they will increase in volume.

**CANADIAN GOVERNMENT PURCHASING COMMISSION.**

**The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George Gault, Winnipeg; Henry Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.**

### Steel Market.

The situation in the steel trade is unchanged, but production is gradually increasing due largely to the growing demand for shells. The demand for steel from manufacturing interests is light and the building trade is quiet. The probability of development in foreign trade is having a tendency to produce a more hopeful feeling in the steel market. This trade is more likely to develop after the war than while it is in progress. Prices on bars, plates and shapes are firm, but unchanged.

### Pig Iron.

The market is in an uninteresting condition and prospects for improvement, even within the next few months, are not at all bright. Pig iron prices are unchanged.

### Machine Tools.

Good enquiry for machine tools for making shells continues, but there is no improvement as regards deliveries. The number of firms taking shell contracts is increasing and there is a corresponding demand for suitable tools. There is a good demand for second-hand tools and for the necessary tooling fixtures.

### Supplies.

Supply houses report business as being brisk, in fact, better than for many months. Prices are unchanged except turpentine, which has declined 5c and is now quoted at 68c per Imperial gallon. This decline is largely due to price cutting, with a view to stimulate business.

### Metals.

The situation in the metal market is unchanged. Copper, antimony and spelter are in good demand for munitions, but ordinary trade is quiet and buying is hand to mouth. The markets are at practically the same level, no changes of importance are to be noted. The spelter situation is unchanged and supplies are scarce. The antimony market is still strong and a shortage is accounted for by the heavy demand for this metal for munitions. The tin market is weak and prices are lower.

**Tin.**—The market is dull and quotations have a lower tendency. The possibility of a long war has had a depressing effect on the London market with a sharp decline in prices of spot tin. The New York market is quiet and weaker. Tin has declined 2c in the local market and is now quoted at 40c per pound.

**Copper.**—The copper market declined in London on account of the unsettled political conditions. The New York market is steady but very dull, although exports of copper are increasing. Local quotations are unchanged at 21c per pound.

**Spelter.** — The market is excited and very strong. The demand continues heavy with spot metal very scarce and futures well sold up. The situation is serious and judging from present outlook is liable to get worse. Spelter has advanced 1c locally and quotations are nominal at 18c per pound.

**Lead.**—The market is firm but very quiet. Local quotations are unchanged at $5\frac{3}{4}$c per pound.

**Antimony.**—The market is quiet and quotations unchanged. The antimony position is a strong one and the heavy demand for this metal for munitions continues. Local quotations are nominal at 40c per pound.

**Aluminum.**—The market is strong and prices nominal. The demand is becoming greater than the supply, and higher prices are anticipated. Quotations are unchanged at 23½c per pound.

## ORGANIZED DEVELOPMENT OF CANADIAN EXPORTS.

ANNOUNCEMENT is made that plans whereby Canadian manufacturers and producers should have opportunity to push their wares in the world's markets have taken definite shape. Application is being made for a Federal charter for a company to be incorporated with an authorized capital of half a million dollars. Provisional directors have been named and managers appointed. The company is to be known as the Export Association of Canada, Limited, and the head office will probably be in Montreal.

### To Operate on Broad Lines.

It is intended that the company shall operate on broad national lines, and while the leading part in its formation is being taken by prominent members of the Canadian Manufacturers' Association, it is not proposed to limits its activities to the handling of manufactured goods, but to operate on the broadest possible basis.

The possibilities of such an organization are enormous, and if carried through successfully should have a most beneficial effect on all Canada. One of the serious factors in the industrial life of Canada has been the restricted market spread over a wide area, which made selling expenses high and added to the percentage of overhead costs. The working up of a large export trade on a permanent basis will at the same time reduce the average cost and add to the employment of labor.

### Provisional Directors.

The provisional directors appointed are: J. H. A. Acer, Laurentide Co., Montreal; G. F. Benson, Edwardsburg Starch Co,, Montreal; C. N. Candee, Gutta Percha & Rubber, Ltd., Toronto; G. H. Duggan, Dominion Bridge Co., Montreal; H. L. Frost, Frost Wire Fence Co., Hamilton, Ont.; C. B. Gordon, Dominion Textile Co., Montreal; R. H. McMaster, Steel Co. of Canada, Ltd., Montreal; W. W. Near, Page-Hersey Iron Tube & Lead Co., Toronto; J. H. Sherrard, Alaska Feather & Down Co., Montreal; A. W. Wheatly, Canadian Locomotive Co., Kingston, Ont.

### General Managers Appointed.

The provisional directors have arranged to secure the services of F. C. Armstrong, of London, England, and R. J. Younge, of Montreal, to organize the association, and afterwards for the first year of operations to act as joint general managers.

Mr. Armstrong, who will have charge of the offices outside of Canada, is a Canadian by birth, and has had a wide experience in foreign trade. During the past fifteen years he has carried out important undertakings abroad on behalf of British interests with whom he was associated, and has thus had an opportunity of studying at first hand the various countries in which the association may expect to find a market for Canadian goods.

Mr. Younge (of R. J. Younge & Co.), who will direct the Canadian office, was for several years general secretary of the Canadian Manufacturers' Association, and is known personally to the leading manufacturers of the Dominion.

### Purpose of the Company.

Briefly stated, the object of the Export Association of Canada, Ltd., is to provide an organization to secure for Canada a new and larger portion of the world's trade under the changed conditions brought about by the war, and to develop and carry on the export trade in Canadian products upon national co-operative lines. Assurances have been given of co-operation by the Dominion Government, the railways and large manufacturing interests for the proposed organization.

Its functions will be: First, to create a favorable strategical position in foreign markets for Canadian industry as a whole; second, to do the work of a commission agent in the sale of Canadian goods in the countries where its branches are established. It should as well be able to render important services in connection with arrangements for overseas transport and for banking facilities necessary for foreign trade. The activities of the association will not be restricted to manufactured goods, but also embrace the assistance of trade in agricultural and natural products.

### Proposed Organization.

The head office of the company will probably be in Montreal and will work in close connection with the Canadian Manufacturers' Association and other Canadian producers, in whose interests the export campaign is to be developed. This office would be so organized as to be able to deal effectively and promptly with all the situations arising from the developing relations between the manufacturers, on the one side, and the foreign branches and their customers on the other.

In its relations abroad the association would aim in the first place at utilizing and strengthening the position of already existing organizations which have developed trade within the Empire, and notably with New Zealand, Australia and South Africa.

### Office in London.

In the second place it is intended to open at once an office in London, England., to assist in securing favorable consideration for Canadian trade in all directions where Governmental assistance can properly be requested, or the influence of financial houses interested in the prosperity of Canada can effectively be brought to bear. Its functions will also be to connect up Canadian manufacturers with all the great purchasing and distributing agencies, both Governmental and private, which make London their headquarters.

Attention will be directed to the French and Belgium markets which will open up, particularly during the reconstruction period, and also to the immense Russian market opening up for manufactured goods of all kinds. Further extensions of the activities of the association to markets such as those of South America, India and the Far East will be made from time to time, as the opportunity seems favorable and the resources of the association permit.

## EQUIPMENT FOR AUSTRALIAN RAILWAYS.

**Tender forms, specifications and drawings have been forwarded by D. H. Ross, Trade Commissioner at Melbourne, for equipment required by the Victorian railways. These tender forms have not yet come to hand, but when received they may be inspected by interested Canadian manufacturers at the Department of Trade and Commerce, Ottawa (refer File No. 1435). Particulars of the requirements, together with the date on which the tenders close at Melbourne, are briefly outlined thus:**

**Victorian State Railways, Melbourne.**

**No. 28,759. July 14.—100 tons white lead in oil.**

**No. 28,811. July 14. — 60,000 flame arc carbons.**

**No. 28,817. July 14.—11,880 feet aluminum feeder cable.**

**No. 28,817. July 14. — Sundry aluminum fittings.**

**No. 28,822. July 14.—125 tons steel channel bars (as per drawing).**

**The departure of mails from Vancouver are indicated as follows: From Vancouver, June 9; due Melbourne, July 3.**

## ONTARIO MINERAL PRODUCTION.

THE production of gold, nickel and iron ore in Ontario increased during the first three months of the year, but the output of silver, copper, pig iron, cobalt, and cobalt and nickel oxides substantially decreased. The drop was most noticeable in silver and pig iron, the decrease in the former being about 30 per cent.

and in the latter 50 per cent. The increase in the production of gold amounted in value to $365,541, the total for the quarter being $1,568,043.

**Low prices of silver** and the shortage of water for power purposes, which impeded operations, are chiefly responsible for the fall in silver production, although the exhaustion of some properties which formerly produced freely was a factor. There is little demand for iron ore, which explains the drop in output, and the war has shut off all exports of oxides to Europe. On the other hand, the war has boomed the nickel industry, and all mines are being worked to full capacity.

The following are the comparative figures for the quarter:

| | 1st 3 months. | Decrease. |
|---|---|---|
| Gold | $1,568,043 | *$ 365,541 |
| Silver | 2,488,909 | 1,060,647 |
| Copper | 526,338 | 65,650 |
| Nickel | 1,496,622 | *50,610 |
| Iron ore | 50,592 | *37,664 |
| Pig iron | 1,158,462 | 1,344,088 |
| Cobalt | 3,718 | 5,180 |
| Cobalt and nickel oxides | 19,686 | 149,279 |

*Increase.

## OPENING FOR NAIL WIRE IN AUSTRALIA.

AN opening for trade in Australia is in the supply of wire for making nails. All supplies at present are received from the United States. American nail wire is found most suitable, not only for the nail itself, but for the nail-making machine.

Some years ago English wire was tried, but did not suit, and then a trial was made with German, with like results. Moreover, from the similarity of the English and German wires it was judged that the English wire was drawn from German rods. The English wire, it is stated, disarranged the cutters of the machine, and the head stampers also, more frequently than the American. The machine needed to be set from two to six times a day with the English wire, whereas with American wire adjustment is necessary only once every two or three days. This means not only loss of time, but expenditure in labor for sharpening the cutters. The consumption of nails is enormous.

One of the two factories in Sydney never allows its stock of nail wire to get below 200 tons. Even in a brick building there is a considerable quantity of nails used for flooring, but in weather board houses the consumption is enormous, and practically all the houses in the country and a fair proportion in the cities are of weather board. The trade is worth capturing.—C.C. Journal.

**Brig.-Gen. Bertram**, chairman of the Shell Committee, has, we understand, confirmed the statement that negotiations are now under way for the establishment of a copper refining plant in Canada. He stated that although nothing has been as yet settled, it was likely the plant would be situated at Trail, B.C., in close proximity to the works of the Consolidated Mining and Smelting Co.

# Canadian Commercial Intelligence Service

**The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.**

# INDUSTRIAL AND CONSTRUCTION NEWS

**Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.**

## Engineering

**Oakville, Ont.**—The Oakville Basket Co. contemplate purchasing a steam engine.

**Deer Lake, Ont.**—The Cordova Mines Co. may purchase an air compressor plant.

**Owen Sound, Ont.**—The McQuay Tanning Co. will buy extra power plant equipment.

**Niagara Falls, Ont.**—An aerial tramway will be constructed across the whirlpool.

**Amherst, N.S.**—The Canadian Car & Foundry Co. will instal a shell forging plant here.

**Prescott, Ont.**—The Prescott Emery Wheel Co. has received an order for lyddite shells.

**Brighton, Ont.** — Extensions will be made to the D. J. Barber Co. foundry at this place.

**Calgary, Alta.** — The Buckeye Machinery Co. of this city has been awarded a contract for 20,000 shells.

**Sarnia, Ont.**—The Loughead Mfg. Co. of this city has received an order for another 100,000 shrapnel shells.

**St. John's, Nfld.**—It is reported that the Reid Co. will shortly engage in the manufacture of shells.

**Medicine Hat, Alta.**—The local plant of the Saskatchewan Bridge and Ironworks may be reopened shortly.

**Quebec, Que.**—L. H. Gaudry, president of the Eastern Canada Steel Co., has obtained an order for 70,000 shells.

**Dutton, Ont.**—The Dutton Electric Light Co. have decided to sell their plant, as hydro power will soon be installed here.

**Walkerville, Ont.** — The Canadian Stamping Co., is breaking ground for a new forging plant 600 ft. long. It will be equipped with the most modern machinery and appliances.

**Hamilton, Ont.**—It is understood that an American firm has practically decided to open up a factory here for the manufacture of locks, bolts, hammers, hatchets, iron randles, etc.

**Victoria, B.C.**—The following local firms have got contracts for shells: Yarrows, Ltd., Victoria Machinery Depot, Hutchinson Bros., Ramsay Machine Works, and the Hafer Machine Works.

**St. Thomas, Ont.**—A company has been organized here for the purpose of manufacturing shrapnel shells for the Canadian and British Governments. A part of the plant of the St. Thomas Steel Vault Co. has been leased. Y. A. Kilpatrick, of Toronto, is interested.

**Shells for the Allies.**—The Dominion Wheel & Foundry Co., Toronto, have applied to the city architect for a permit to erect a $7,500 addition to their factory on Eastern avenue. The new addition will be devoted entirely to the manufacture of high explosives for the Allies.

## Trade Gossip

**Calgary, Alta.**—A company is now being organized to operate a large abattoir and packing plant at Calgary.

**St. John's, Nfld.**—Machinery to be used in the equipping of a building for a wireless station is now being conveyed to the selected site, Mount Pearl, St. John's West.

**The Sudbury Construction & Machinery Co., Sudbury, Ont.**, have bought a 2½ ton refrigerating planter from the Vilter Mfg. Co., Milwaukee, Wis.

**Hamilton, Ont.**—A. C. Daun, general manager of the Oliver Chilled Plow Works, announced recently that owing to shortage of material, the company had found it necessary to close down for 30 days.

**The Vilter Manufacturing Co.**, Milwaukee, Wis., have sold the following refrigerating plants to the Borden Condensed Milk Co:—14-ton plant to the Norwich factory; 25-ton plant for Tillsonburg, Ont., and a 24-ton plant for the factory at Ingersoll, Ont.

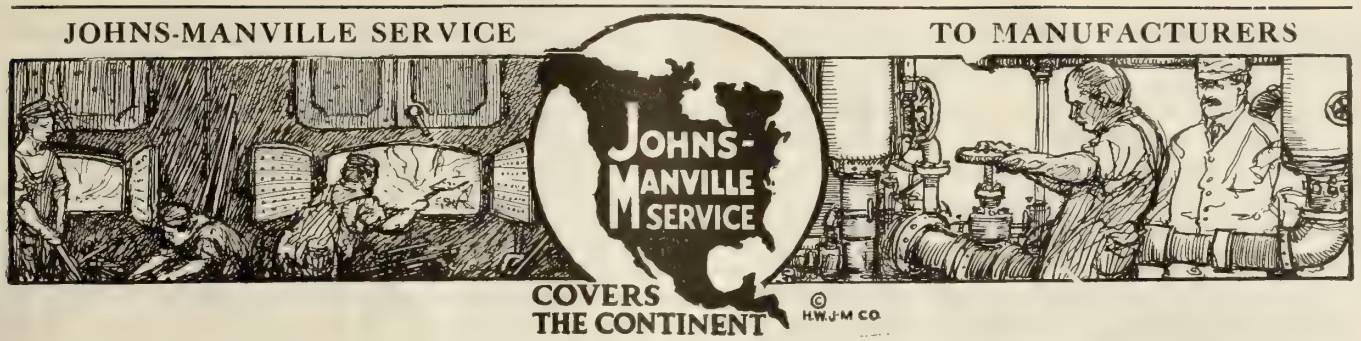
**Windsor, Ont.**—An appropriation of $2,000 will be made by the city council to aid in a campaign for more industries for Windsor if the recommendation of the transportation and industrial committee is approved.

**Vancouver, B. C.** — The British Columbia Mills, Timber and Trading Co., owners of the Hastings Sawmills, have received an order for some 10,000,000 feet from the British Admiralty, according to an announcement made recently by Eric Hamber, the vice-president and general manager.

**C. Ross Cameron**, sales manager the Wm. Hamilton Co., Peterborough, Ont., has resigned his position to go to the front as lieutenant in the machine gun battery, 3rd contingent. G. R. Munro, chief engineer will assume the duties of sales manager in addition to those of his own department.

**Ross Rifle Output.**—We understand that due to the improvement and enlargement of the Ross Rifle Factory at Quebec, some 1,500 rifles per week are now being regularly turned out. The British War Office is reported to have placed a large order for this Canadian made and Canadian service arm, and due to our own and the above require-

JOHNS-MANVILLE SERVICE TO MANUFACTURERS



# Your purchases will eventually be a part of your plant equipment—or of your product. In either case they are important.

You can appreciate the economy of buying many products from one source.

You can conceive the convenience of having a national organization at your service wherever you are.

You can understand the safety of having all your purchases backed up by a company that stands responsible for its products and that realizes how important your purchases are.

The economy, convenience and safety of buyers is the real significance of Johns-Manville Service, for to insure these stands J-M Responsibility.

# J-M Asbesto-Metallic Brake Blocks are different from anything you have yet seen

Whether you sell machinery equipped with brakes or use brakes on your own machine, it will pay you to look into the service these new brake blocks give. They are absolutely sure, brake with ease and smoothness and are extremely economical because of their durability. The base of J-M Asbesto-Metallic Brake Blocks is Asbestos combined with other materials in a form to render an ideal gripping medium—better than wood to metal or metal to metal; yet they will outlast six to ten sets of wood blocks, will not burn or char and are unaffected by oil, water or climate.

Carried in standard shapes and sizes and also furnished to sketch.

# J-M Mastic Flooring has so much in its favor, we really have to say "It is the best"

Each kind of shop flooring has some one strong point, or points; but this flooring does actually combine the good points of all. This can be demonstrated by J-M Mastic Floors in actual use.

These floors are comfortable as wood, and firm as concrete; but they are durable, do not originate dust, are naturally dry and dry quickly after flushing, as they are waterproof. They are not affected by acids or alkalies. Base is Trinidad Lake Asphalt, which makes them durable as asphalt street paving.

Applied over any firm, stable surface; can be put on over old flooring. Any consistency to meet varying conditions.

*Our literature on these products will interest you. Send to-day.*

*U.S. Parcels Post-Room, La Salle Street, Chicago, Ill.*

**Advertising**

"Advertising is the education of the public as to who you are, where you are, and what you have to offer in the way of skill, talent or commodity. The only man who should not advertise is the man who has nothing to offer the world in the way of commodity or service."—*Elbert Hubbard.*

ments, a large order from the Russian Government has meantime been refused.

**Tank Steel Inquiry.**—The department is in receipt of a cable from J. E. Ray, Dominion Trade Commissioner at Birmingham, England, calling attention to an inquiry for 3,000 tons of tank steel sheet. It is stated that urgent quotations are desired. The size required is six millimetres by a thousand millimetres and may be of any length most suitable for the work. Prices should be c.i.f. a Russian port. Manufacturers are required to state the earliest date on which they can make delivery.

**Canada's Coal Output.**—Coal formed more than one-fourth of Canda's total mineral output in 1914. The Dominion production of marketable coal in that year amounted to 13,594,984 short tons, valued at $33,433,108 as against 15,012,178 tons, valued at $37,334,940 in 1913. British Columbia's output totalled 2,238,339 tons in 1914, a decrease of 476,081 tons, while that of Yukon Territory was 13,443 tons, a decrease of 6,279 tons.

**Intercolonial Railway.**—The Intercolonial Railway is spending nearly $3,000,000 this year on equipment. This includes 12 super-heat equipped locomotives, 10 Pacific type locomotives, 6 consolidated locomotives, 4 switching locomotives, ballasting equipment and rail loaders, 200 steel flat cars, 250 steel gondola cars, 4 light wrecking cranes, 8 sleeping cars, 4 steel sleeping cars, 4 baggage cars, 2 postal cars, etc. Some of this equipment has already been delivered and placed in service.

**Prince Rupert, B.C.** — The last pontoon for the Grand Trunk Pacific dry dock was launched recently. The dock and shipbuilding plant will be ready, with a complete complement of machinery for ship repairs, by August 1. The oil tank equipment at Prince Rupert is also completed and a few days ago the first oil-burning locomotive brought train No. 1 into the Pacific Terminal. In a short time over the whole of the Grand Trunk Pacific line from Jasper westward will be operating with oil-burning locomotives.

**After Skilled Labor.** — George N. Barnes, Labor M.P., and secretary of the Amalgamated Society of ngineers, and W. Wyndham, permanent official of the labor exchange department of the Board of Trade, are coming to Canada on the Adriatic to make enquiries concerning suitable skilled labor for the war munition factories in Great Britain. The Board of Trade understand that there is some unemployment even among skilled artizans in Canada, and if this is so, the delegation will proceed to Ottawa to confer with Sir George E. Foster, and will also visit large employers of labor.

**Canadian Trade Returns.**—An increase of $10,000,000 in Canadian trade during April over the corresponding month last year is shown by figures just issued. The total trade last month was $65,000,000. Exports of manufactured articles were valued at $13,000,000 compared with $4,000,000 for the same month in 1914, while exports of merchandise totalled $28,691,000 as against $17,751,000 for April of last year. While exports increased, imports decreased considerably, totalling $28,391,000 as against $36,937,000 for April, 1914, the duty realized being $5,986,000 compared with $6,458,000 for the corresponding month of last year. Of the exports that of animals and their produce bulked largest, being $3,312,000 compared with $1,860,000 in 1914.

**No Morgan Monopoly.**—In the British House of Commons, on May 19, Harold Baker, Financial Secretary of the War Office, stated that the existing contract between the British Government and the firm of J. P. Morgan Co., of New York, does not debar the giving of business to other firms in the United States, should circumstances make such a course advisable. This announcement was made in answer to a question asked by Sir Richard A. Cooper, who wanted to know if firms in America which declined to negotiate with or through the Morgans were still able to supply Great Britain with munitions of war. Mr. Baker said: "The War Department is free to place orders with any firm in United States, and will do so on any proper occasion."

## Municipal

**Owen Sound, Ont.**—Council will raise $10,000 for new water mains. R. McDowell, town engineer.

## WANTED

**Foundry and Machine Shop**

To locate in the flourishing Town of Hawkesbury, where amongst four fairly large manufactories, in the last three years one firm alone used 400 tons.

WHERE—Abundant electric power is available at reasonable rates ($25 H.P. per annum).

WHERE—Shipping is easy by the G.T.R. and Canadian Northern main line and Ottawa River.

WHERE—Much old casting and scrap iron is available.

WHERE—An important famous trade in foundry work could be waked up.

Also good opening for other industries.

For particulars apply to

BRUNO BOUVRETTE,
Secretary,
Hawkesbury Board of Trade.

ing to Montreal he was general sales agent of the American Car & Foundry Co., at St. Louis, Mo.

**Walter Dowker Beardmore**, head of the firm of Beardmore & Company, passed away on May 23, in his 66th year, at 50 Crescent Road, Toronto, Ont. The late Mr. Beardmore was born in Hamilton in 1849, the eldest son of the late George Lissant Beardmore, and received his education in England and at Upper Canada College. His father established the business from which developed the concern now known as Beardmore & Company, tanners and leather merchants, one of the largest firms of its kind in Canada, having houses in Toronto and Montreal, and tanneries in Acton and Bracebridge. Besides being president of Beardmore & Company, the deceased was a director of the Mutual Life Association, president of the Dominion Lumber Co., the Muskoka Leather Co., the Acton Tanning Co., and the Beardmore Belting Co.

## Tenders

**Peterborough, Ont.**—Tenders are being called until May 31 for an auxiliary pumping unit. Full particulars may be obtained from S. R. Armstrong, secretary Utilities Commission.

**Hull, Que**—Tenders will be received up to June 7 for the supplying of waterwheel, electric generator and centrifugal pumps. Specifications and plans may be obtained at the office of the city engineer, J. P. A. Laforest.

**London, Ont.**—Tenders will be received up to June 2 for a modern combination chemical and hose car, equipped with one 40-gallon tank, and having capacity for carrying 1,200 feet of 2½-inch hose. Full information will be furnished by Fire Chief John Aitken.

**Montreal, Que.**—Tenders will be received up to Monday, June 7, 1915, for the construction of west extension grain elevator No. 1, Harbor of Montreal. Conditions upon which copies of the plans and specifications may be obtained will be furnished upon application to F. W. Cowie, chief engineer.

**Ottawa, Ont.**—Tenders will be received up to July 1, 1915, for the manufacture, supply and erection of a 30-ton steam wharf crane, of the derricking jib type, for Halifax, N.S., dockyard. The specifications and conditions of contract may be seen at the office of the consulting naval engineer, Ottawa.

**Winnipeg, Man.** — Tenders addressed to the Chairman, Board of Control, will be received up to Saturday, June 5, 1915,

for the manufacture, delivery and erection in the generating station at Point du Bois of one 150 k.w. motor-generator exciter set. Instructions to bidders, specifications and form of tender may be obtained at the office of the City Light and Power Department, 54 King street, Winnipeg.

**Wallaceburgh, Ont.**—Tenders will be received by the town clerk until Tuesday, June 1, 1915, for the following works: Contract "A-1"—laying water mains; "A-2"—laying sewers; "O"—Laying sewer force mains; "P"—constructing sewage pumping stations; "T" — constructing electric transmission line. Plans and specifications may be seen at the office of Chipman & Power, engineers, Mail Building, Toronto, or at the resident engineer's office, Wallaceburg.

## Contracts Awarded

**Welland, Ont.**—At a special meeting of the town council last Friday night, the tender of the Star Electric Co. of Newark, N.J., for the fire alarm system at the price of $4,926 was accepted.

**Woburn, Ont.**—Scarboro' township council has awarded a contract for a bridge near West Hill to the Sarnia Bridge Company. This additional work will bring the cost of the bridge up to $2,200. It will have a 70-foot span.

**Montreal, Que.**—Estey Bros. Co. of this city have secured the contract for the ornamental iron and bronze work on the Sun Life Building, Montreal.

**Toronto, Ont.** — The following contracts have been awarded by the Board of Education, in connection with the new administration building: Structural steel, Dominion Bridge Co., $14,590; fireproof floors, Jas. A. Wickett, $6,957; plumbing, heating, etc., the John Ritchie Co., $13,800. Other tenders bring the price of the whole building up to $106,307.

## General Industrial

**Sarnia, Ont.**—F. A. Gordon of this city may build a flax mill at Petrolia. Gas power will be used.

**Raymond, Alta.**—It is reported that an elevator will be built here by one of the largest grain companies in this province.

**St. Thomas, Ont.**—The Canadian Smallwares Co. plant, which was recently destroyed by fire, will be rebuilt. R. H. Dowler is interested.

**Fenelon Falls, Ont.**—Thomas Hodgson late manager of the Wood Products Co., Donald, Ont., is associated with a

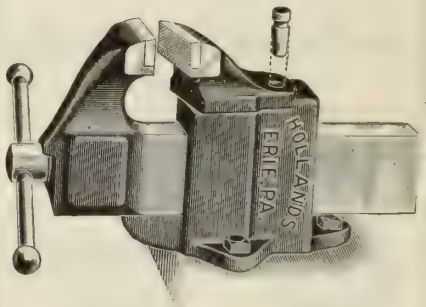
VISE EFFICIENCY



Hollands Vises meet the requirements of mechanics who demand the highest efficiency, combined with maximum strength and durability.

It is not economy to buy cheap vises.

Our Catalog No. 22 will explain why many of the leading industrial shops have used our vises for over a quarter of a century.

Hollands Mfg. Co.

Established 1887

Erie, Pa.

syndicate who propose to build a chemical works here.

**Alvinston, Ont.**—The Alvinston Flax Mill will resume operations after standing idle for some years. A large amount of acreage has been secured by John Irving, the local manager.

**Peterborough, Ont.**—It is rumored that a well-known Berlin business man is making arrangements for the erection of a large up-to-date factory building on the corner of Cedar and Elgin streets.

**Goderich, Ont.**—The ratepayers of Goderich carried a by-law to assist the North American Chemical Co., to extend their salt plant here by granting exemption from taxation and by furnishing electric power free of charge. The vote polled was a comparatively small one, 463 being in favor of the by-law and 75 being opposed to it.

## Building Notes

**Oshawa, Ont.**—Tenders are being called for a public school. Ellis & Ellis of Toronto, are the architects.

**Vancouver, B. C.** — The proposed armory at Grandview will be 225 feet by 120 feet. Major C. B. Fowler, of this city, is the architect.

**Outremont, Que.**—The Catholic School Board propose building a school to cost $200,000. A permit has been granted by the town council.

**St. John's, Nfld.** — The Commercial Cable Co. will erect an office building here to cost $80,000. W. T. Ellis is the general contractor.

**London, Ont.**—Members of the medical faculty of the Western University have inaugurated a campaign to obtain funds for the erection of a new medical school building to cost $100,000.

**Ingersoll, Ont.**—Architect Nicholson, of St. Catharines, is preparing plans for a new school. Alternative proposals call for an expenditure of $36,000 to $85,000.

**Toronto, Ont.**—It is announced that a new theatre will be built here to replace the Princess Theatre recently destroyed by fire. Howard Crane, of Detroit, Mich., is the architect.

## New Incorporations

**The Aetna Chemical Co. of Canada, Ltd.**, has been incorporated at Ottawa with a capital of $1,800,000 to manufacture cordite, lyddite, turpinite, nitroglycerine, trinitrotoluol, and other explosives.

# PATENTS

## Secured or Fees Returned

## SEND YOUR INVENTION DIRECT TO OTTAWA—

The Patent business of Canada naturally centers in Ottawa. Here are the records of the Patent Office, and here is its examining corps, before some one of whose members all Applications for Letters Patent must pass for review and criticism. That such application may be facilitated and **much time saved by the employment of competent attorneys on the ground with** ready access to the Patent Office for personal oral discussion of cases with the examiners and prompt filing of amendments and other documents, is obvious. This is admitted by all the large firms located in other cities, practically all of whom are represented in Ottawa, and that **inventors have come to see the great advantage of sending their cases direct to Ottawa,** avoiding the delays and occasional misunderstanding, incident to passing the case, and amendments through two or more Attorneys' offices, is abundantly shown by the large number of applications filed directly through Ottawa Patent Attorneys.

Being located only one door from the Patent Offices, we are in the best position to give you valuable assistance in securing your Canadian Patent. We assure you that in placing your Invention in our hands, it will receive prompt and competent attention. The policy of this firm is to give the best satisfaction possible to our clients.

### WE MAKE A FREE SEARCH OF PATENT OFFICE RECORDS—

If you have an invention, send us a sketch, photograph or model of it. We will give you a report as to its patentability absolutely free. **We have a number of mechanical engineers and skilled draftsmen who are at the service of our clients to assist them in perfecting their inventions with meritorious ideas, and who require expert advice to produce the invention in practical and commercial form, and the suggestions of our experts are of great aid to our clients.**

**PATENTS FOR SALE** **We invite Manufacturers and Promoters to address our Sales Department regarding the purchase or leasing of a number of meritorious Patents secured by us.**

THE PATENT REVIEW

Largest circulation of any publication devoted entirely to Patents. **Send for a copy at once.**

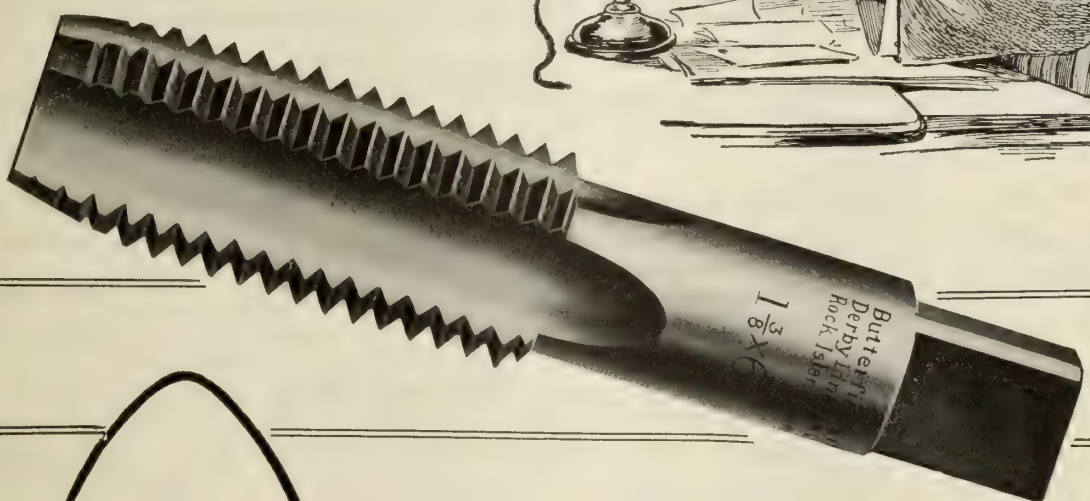
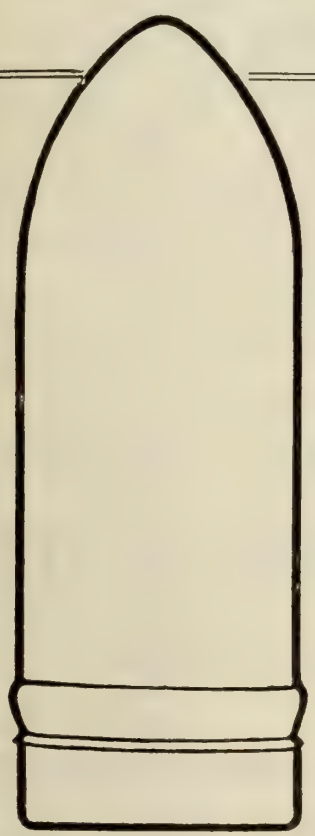
# You can make more profit on Shells

or on any product where tapping is required by using

## BUTTERFIELD TAPS





**Butterfield Taps are pre-eminently superior in the tool world.**

We have subjected them to many exhaustive working tests against other makes, and on every occasion they have produced more work in a given time and lasted longer.

*Send a trial order now*—you have everything to gain and nothing to lose.

**MADE IN CANADA**

# SHELLS AND FUSE PARTS

# Machinery In Stock

# QUICK DELIVERY

15—2" x 24" Jones & Lamson Turrets, some with 3" automatic chucks.
5—2" x 24" Jones & Lamson Turrets with cross sliding head
3—3" x 36" Jones & Lamson Turrets with cross sliding head.
4—$2\frac{1}{4}$" x 26" Warner & Swasey Hollow Hexagon Turrets.
8—20" American Patent Head Lathes, 8 and 10 ft. beds. Motor drive, new.
4—24" Schumaker & Boye & Bradford Lathes, 12 and 14 ft. beds.
5—20" Baker Bros. Column Pattern Drills.
2—24" Bickford Column Pattern Drills.
10—30" to 36" Vertical Chucking and Boring Mills.

## ALSO OVER 1000 OTHER MACHINES

**This is not an old list, but was made up May 22nd and includes machines which we have in stock now.**

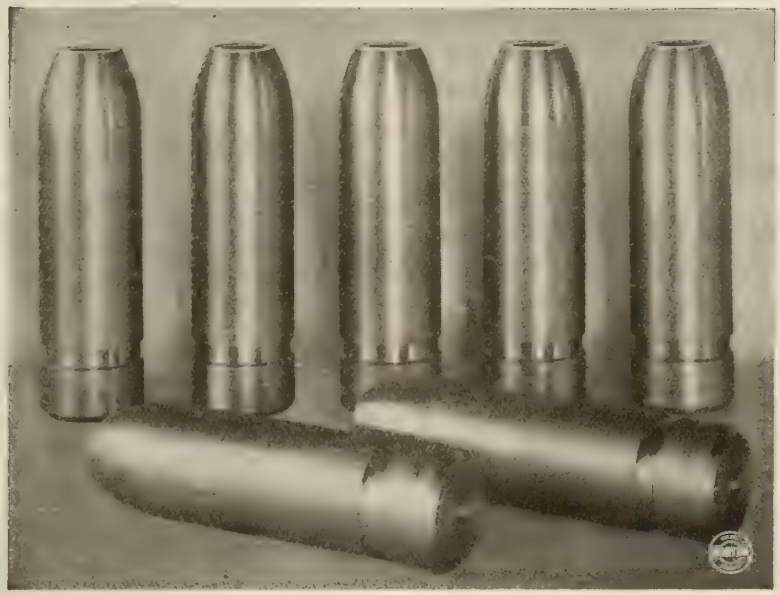
# NORTON
# Alundum Wheels for Shrapnel Grinding



The grinding wheel and the grinding machine are big factors in the manufacture of shrapnel.

The sizes and forms of shrapnel must be almost exact. As a means of securing the necessary accuracy and at the same time the largest production at small cost, the leading manufacturers of shrapnel and shell are adopting grinding methods.

Naturally, Norton Alundum Wheels are the first choice—Alundum the abrasive for steel and its alloys—the wheel that can be trued or formed to the desired shape and which will stand up to the work.

# TURNING LATHE

## For 4.5 and Shrapnel Shells

Output of thirty shells per hour and over can easily be maintained by this Turning Lathe. The machine is fast, safe, and has been adopted by the principal manufacturers of shells. **Telegraph for deliveries.**

## The Jenckes Machine Co., Limited

**Lansdowne Street, Sherbrooke, P. Que., Canada**

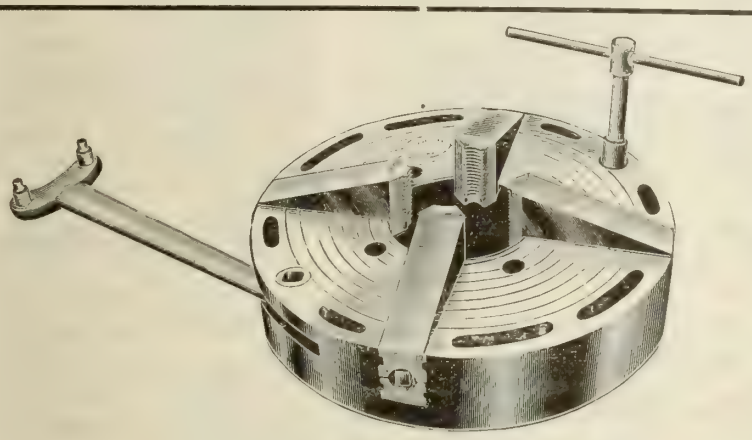
BAND TURNING LATHE



# For SHRAPNEL, SHELL and LYDDITE WORK

**Jaws any required bite.**

## WESTCOTT CHUCK CO.

**ONEIDA, N.Y., U.S.A.**

**No. 314 Heavy Pattern High-Speed Drill**

IT'S A BAKER

## Enlarging 2½" hole to 4" in hammered steel forgings at the rate of 4" feed per minute

THIS DRILL PRESS HAS AMPLE CAPACITY TO DRIVE 3-INCH, HIGH-SPEED DRILLS TO THE LIMIT OF THEIR EFFICIENCY IN STEEL. IT WILL BORE WITH GREAT EFFICIENCY IN STEEL OR CAST IRON UP TO 6 INS. A **rigid, rapid, powerful machine,** driven by positive, fast-running gears immersed in oil. Eight speed and twelve feed changes within easy control of the operator.

BAKER DRILLS ARE POPULAR TOOLS ON LYDDITE AND SHRAPNEL **because they produce accurate and dependable work at extremely low labor cost, low installation cost and they take small floor space.**

May we furnish more reasons why you need them?

WHEN you need new equipment or supplies for your machine shop

**Consult this Directory**

¶ You'll find listed here the reliable makers of the lines you need; firms who believe in the progressiveness of present-day manufacturers and who appeal to their intelligence through their own engineering journal.

¶ Consult Canadian Machinery Buyers' Directory and you can't go wrong in your buying.

# Go to Chicago With Your Ad Man

**Attend with him the big Convention of Associated Advertising Clubs of the World, June 20 to 24, 1915.**

You will assimilate more knowledge of modern methods of Advertising, Selling, Distribution, and Management during these five days than could be obtained in a life-time of book study.

You will be brought in touch with the men who have done and are now doing the big things of business. You will participate in the biggest business meeting the world has ever known. You will listen to the expressed thoughts of distinguished Americans concerning present day and future business movements.

You will enjoy Chicago's wonderful park system, boat rides on Lake Michigan, modern hotels, theatres, and other amusements, including the big street pageant, and the Gridiron Show given at the Auditorium Theatre by 150 Chicago Advertising men.

*Distinguished Speakers.* President Wilson, State conditions permitting, will head the notable array of speakers. Hon. William Jennings Bryan, George Horace Lorimer, Arthur Brisbane, John H. Fahey and Henry Watterson are among the others who will be heard.

**Advertisers in and publishers of trade and technical journals will hold special Departmental meetings to discuss their own problems and learn how they can co-operate to better advantage. Other departmental meetings will take up such subjects as catalogues, engraving, printing, mailing lists, sales plans and kindred subjects.**

*The ladies* are wanted too. Special entertainment—teas, luncheons, automobile trips, etc.—is being arranged for them by Mrs. Chas. H. Porter and her committee.

Clear up your desk. Take a five days' vacation in a lake-cooled city. Mix with the business builders. You will return a better business man; a better physical man; and a better thinking man.

**For further information, programme, rates, etc., address Convention Bureau, Advertising Building, Chicago, Ill.**

**CANADIAN MACHINERY, 143-153 University Ave., Toronto**
**Montreal Winnipeg Boston New York Chicago London, Eng.**

# CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS--Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5.00 per line a year is charged to non-advertisers.

# No, Stevens' Stopper won't stop a train, but it will stop the blow hole in a defective casting so that you cannot find it.

In this way, it helps your bank account. The casting that otherwise would have to go to the scrap heap can be converted into good coin of the realm.

Same color as the rest of the casting. Doesn't look like a blue patch on Casey's faded overalls.

*How to use Stevens' Stopper, or Circle Cement:*

Stevens' Stopper is a fine powder, used with a little water and made into a paste—the hole is easily filled with a putty knife or trowel. It takes anywhere from two to twenty-four hours, depending upon the size of the patch, for the filler to become as hard as the casting itself. When rubbed with a file it shows the color of the casting, hence it is the best filler and the one thing that saves your castings, and that means the saving of your dollars.

Another thing—I do not ask a fancy price for it.

A pound will save many dollars' worth of castings. Put up in 5-lb., 10-lb., and 25-lb. cans.

FREDERIC B. STEVENS

Manufacturer of
Foundry Facings and Supplies, Buffing Compositions and Platers' Supplies

Corner Larned and Third Sts. DETROIT, MICH.

BRANCHES

WINDSOR, ONTARIO, 20 PITT STREET
INDIANAPOLIS, IND., 138-140 SOUTH DELAWARE STREET

# Nova Scotia Steel and Coal Company, Ltd.

## BEG TO ANNOUNCE

That their new Steam-hydraulic Forge Shop is now in operation, as also is their recently installed "Harmet" Fluid Compression Plant.

These improvements bring "Scotia's" Equipment abreast of the best foreign forges.

They are accordingly open to supply forgings of all shapes and sizes, made of Best Ordinary or Fluid Compressed Open-hearth Steel, and satisfying the most severe specifications.

For prices and particulars apply to

**Western Sales Office, Room 14, Windsor Hotel, Montreal, Que., or Head Office, New Glasgow, Nova Scotia**

# No. 5 "Lincoln" Miller

## MADE ESPECIALLY FOR MILLING BRIDGE REAMERS

You will notice that this machine has a double or elevating table, the top section being pivoted at the rear end, and raising and falling between substantial guides cast with the lower half or side on the front.

Provision is made to bolt suitable cams or forms to side of table, which engage with roller carried by a bracket bolted to face of saddle as seen in illustration. These cams are so formed and applied as to allow for continuous fluting of reamers having both initial and secondary tapers or with taper start and straight body.

THE EIGHT SPINDLE CENTERS SHOWN MOUNTED ON TABLE OF MACHINE INDEX IN UNISON, AND THE COMBINED EQUIPMENT MAKES A VERY EFFICIENT MACHINE FOR THE CLASS OF WORK INTENDED.

**Let us tell you more. Mail us your request for catalog and full information.**

# Starrett Calipers

## Kinds

Starrett Calipers are made in a number of styles and sizes to suit every practical need of machinists and toolmakers. There are round leg toolmaker's spring calipers, Fay patent calipers, with split nut for quick action, Yankee spring calipers similar to the Fay but not quite as heavy. There are firm joint calipers, screw-adjusting firm joint calipers, lock joint transfer calipers for transferring measurements over ribs, flanges, bosses and in chambered cavities and several other special styles. These are all made of the best steel perfectly tempered to give longest service.

## Hermaphrodite Caliper

The Hermaphrodite calipers shown here have sensitive adjustment and are made in the following sizes:

4″—$0.90, 6″—$1.00, 8″—$1.25, 10″—$1.50

**No mechanic should purchase calipers or any other tools without consulting the Starrett 320-page catalog No. 203 (sent free on request) for styles, sizes, and prices.**

# CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied fields. Published by the MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg and London, Eng.

Vol. XIII | Publication Office: Toronto, June 3, 1915 | No. 22

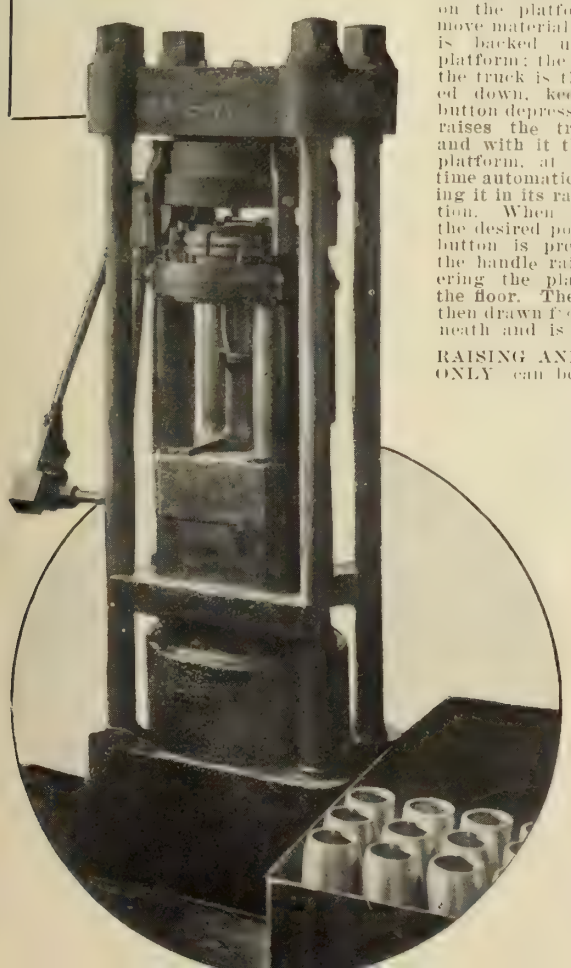
## You can greatly reduce the cost of handling SHELLS

or any factory product, from one operation to another, by using our

## ELEVATING TRUCK

All material is stacked on the platforms. To move material the truck is backed under the platform; the handle of the truck is then pushed down, keeping the button depressed, which raises the truck bed, and with it the loaded platform, at the same time automatically locking it in its raised position. When hauled to the desired position the button is pressed and the handle raised, lowering the platform to the floor. The truck is then drawn from underneath and is ready to move another platform.

RAISING AND LOWERING OF THE TRUCK CAN BE OPERATED WITH ONE HAND ONLY can be raised or lowered at any angle. Specially designed ball-bearings throughout.



## Hydraulic Press for Shell Banding

A STRONG, SIMPLE AND RELIABLE MACHINE AT LOW COST.

Power is obtained from continuous running belt-driven pump located near the press, and is applied to the ram underneath the table.

TABLE RISES AND FORCES STEEL TAPER WEDGES, EIGHT IN NUMBER, UP INTO THE HOLLOW CASTING AT THE TOP, THE WEDGES CONFORMING TO THE SHAPE OF AND ARE THUS PRESSED IN EQUALLY AGAINST THE COPPER BAND. PRESSURE IS THEN RELEASED, THE SHELL IS READILY TAKEN OUT.

Operates by lever shown on left-hand side.

Pressure gauge behind.

As this machine is a Standard Hydraulic Press it can be used in any other capacity.

We also manufacture **LOADING FUNNELS, BALL-BEARING TIGHTENING NUTS, BELT-DRIVEN LOADING VIBRATORS, BENCH VISES.**

WE SHALL BE PLEASED TO SUBMIT PRICES AND GIVE ANY PARTICULARS REQUIRED.

# The Tap with the
# Con-eccentric Land
## For Tapping Nuts

**One-third of the land from the cutting edge is concentric. The remaining two-thirds has eccentric relief.**

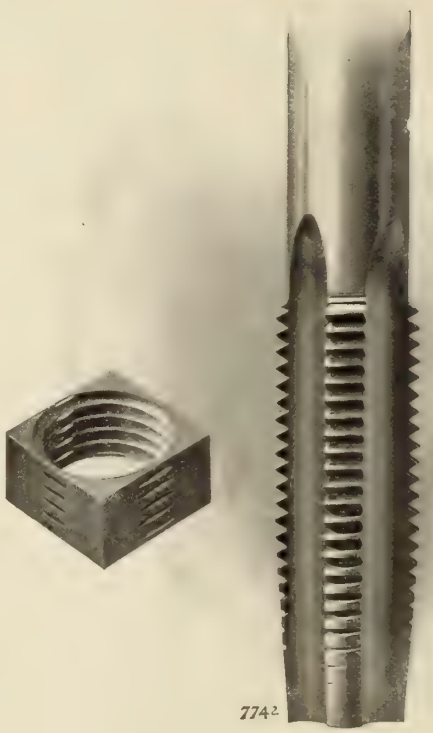
TO show more clearly the free-cutting qualities of these taps, a nut slightly smaller than one and one-quarter inches square was drilled for tapping and held lightly by the corners. The nut was then tapped with a 1¼-7 U.S.S. con-eccentric tap, driven through without reversing. (See cut on right).

So perfect were the cutting qualities and so easily and freely was the work done that this mere shell of a nut was *not even distorted,* to say nothing of being split as would have happened with a tap differently constructed.

Consider what this means to the nut manufacturer from the standpoint of a *saving in power.* This is but one reason why Pratt & Whitney taps are specified by the largest nut manufacturers in the country.

For a number of years we have made taps with this style of relief. They have won out steadily and consistently on merit alone.

**Write for our Booklet "The Tap with the Con-eccentric Land."**



TAPS can be sharpened at the only correct point — on the face of the cutting edge.

Sharpening in no way affects their size.

Can be sharpened long after other so-called eccentrically-relieved taps are rendered useless.

We obtain the freest cutting tap with the longest life—an exclusive combination.

Accuracy nowhere else obtainable is secured together with a degree of finish and refinement heretofore thought impossible in a commercial tool.

We want tap users to know *why Pratt & Whitney taps are best,* also that our claims are based on reasons mechanically correct.

Cut to left is a tapped nut sawed in half showing small area of metal which held it together.

The taps are carried in stock by our Branch Offices and Agencies throughout the world. Prompt service assured to all customers wherever located.

## To Makers of Shells

¶ To-day the cry is "Munitions"! It is insistent. It must, of necessity, be heeded. It has met with a wonderful response, and what has gone before is small compared to that which will shortly follow.

¶ To-day we *must* make shells, but what about to-morrow?

¶ What of your regular product? That's the question.

¶ It may be, it probably will be, that shell manufacturing will go on and on for months. Gradually, though, the market for your regular product will loosen up, and there may be no need for a lull in the activity in your shops when the dogs of war are called off, and the dove of peace flits over the desolate battlegrounds of Europe.

¶ Canada's opportunity to jump into long pants as a manufacturing nation is here. *Your* opportunity should not be neglected while shells are being made.

¶ Keep your regular line before future buyers while you go on turning out shells. Every shell you make will count in securing victory. You owe it to your business to set aside a small fraction of the profit on each shell you make for the purpose of keeping your standard lines alive in the public mind against the day when shells will be made in your shops no more.

*Rate cards and full information will be sent on application.*

# NORTON
# Alundum Wheels for Shrapnel Grinding

The grinding wheel and the grinding machine are big factors in the manufacture of shrapnel.

The sizes and forms of shrapnel must be almost exact. As a means of securing the necessary accuracy and at the same time the largest production at small cost, the leading manufacturers of shrapnel and shell are adopting grinding methods.

Naturally, Norton Alundum Wheels are the first choice—Alundum the abrasive for steel and its alloys—the wheel that can be trued or formed to the desired shape and which will stand up to the work.

# Impromptu Production of Shell Cartridge Cases

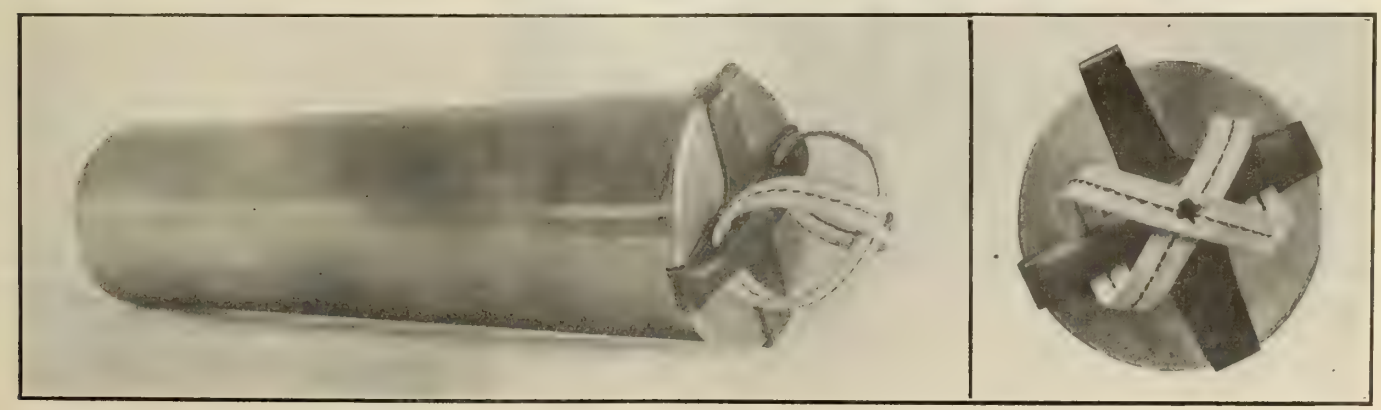
Staff Article

*In addition to the manufacture of shrapnel and high explosive shells, there is also being undertaken in our midst the production of the accessory brass cartridge cases for these respective and meantime highly useful and necessary commodities. The accompanying illustrations and description refer in their entirety to the methods and devices employed and the equipment adaptation found in the motive power department of one of our leading railroad corporations. It will be easily apparent from perusal of the data that ingenuity of no mean order has been displayed and relative success achieved.*

TO-DAY, while there are upwards of two hundred Canadian machine shops engaged in the manufacture of shells of various kinds, the number of concerns manufacturing the brass cartridge cases can perhaps be counted on the fingers of one hand. This industry will, no doubt, however, soon occupy a larger portion of our attention than it does to-day. Up until the present there has never been a demand for cartridge cases in Canada, hence there was no machinery designed or installed especially to serve this particular purpose. In the shop which this article is intended to describe no special equipment has been purchased to carry out cartridge case work, and for that reason the tools, dies, fixtures, and machines are all the more interesting. This is true not only from their educational value to the men engaged in the business, but because their very nature is so ingenious that the interest of every mechanic and engineer, even though engaged in work of a vastly different character, is attracted.

The elaborate system of dies and punches fitted up on bulldozers, planers and hydraulic presses have been most carefully designed and delicately made. However, the varying natures of the machines to which they have been attached verily causes us to hold up our hands in wonder and astonishment. These machines, which in times of peace, have been employed exclusively in railway work, are indeed now contributing to a page in Empire history. Our engineers and shop superintendents have risen to the occasion in developing tools and in designing machines and equip-

CANADIAN-MADE 18-POUNDER SHRAPNEL SHELL AND CARTRIDGE CASE.



CARTRIDGE CASE WITH DRAWING CLIP ATTACHED.

This clip is one of the invidentals being made in Canada for the British Government and forms an interesting job of blanking, piercing and drawing.

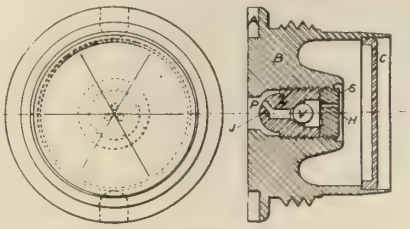
ment, and the successful outcome shows them to be as resourceful and ingenious as those of the older and perhaps more highly developed countries.

### Quality of Brass.

Whether manufacturing the short cartridge case for the howitzer or the long case for the shrapnel, an extended series of drawing-out processes is required and between each drawing-out operation, annealing must occur to restore to the metal the ductility which the draw has destroyed. The composition of the brass can be roughly stated as being two parts copper and one part zinc. This metal possesses very high tensile strength when annealed and of the proper hardness. It is received in large sheets or plates of .380 of an inch in thickness. In this shop two types of cartridge cases are made. The first type is for the 18-pdr. shrapnel shell which is being manufactured in Canada today on a larger scale than that of any other. The second cartridge case is the case for the 4.5 howitzer. In this article both cases will be dealt with, the operations on the 18-pdr. shrapnel cartridge case being followed out in the first instance.

### 18-pdr. Shrapnel Cartridge Case—First Operations.

The first operation is to punch out from the plates of .380 thickness round discs of diameter 6.22 inches. These plates then pass to the cupping or second operation. This cupping operation is done on a motor-driven Williams & White, Moline, Ill., bulldozer, which is shown in Fig. 1. As will be seen, there are three punches fitted to the frame, while the three sets of dies are on the travelling carriage of the machine. The central punch performs the cupping operation. Fig. 2 shows the nature of the dies and punch which cup the disc. The dies, as will be seen, are bevelled



FULL-SIZE SECTION OF BRASS PERCUSSION PRIMER.

at an angle of 45 degrees to facilitate the entry of the disc therein. It will be noted that there is a small air vent in the punch which allows any trapped air to escape, and thus prevents wrinkles in the cupped disc. For similar reasons, practically all the punches are equipped with these air vents.

By referring to Fig. 3, the dimensions of the cupped disc are plainly seen. The dies and punch are covered with mineral tallow, which has been found to be about the best lubricant for this work. The third operation is annealing. The cupped discs are placed in boxes at the rear of the machine, whither they are conveyed by the motion of the punch. Immediately upon leaving the dies, the cases slide into a galvanized iron conveyor tube, and, as the punch comes through the dies, it pushes the cups along the tube with each stroke. They are pushed into a wooden shute at the rear of the machine and slide into boxes at the rear of the bulldozer. These boxes are put on trucks, which run on the standard gauge tracks throughout the shops, and are thus carried to the blacksmith shop, where the huge annealing furnaces are situated. The furnaces are of the oil-burning type, built in the shops of the company. One of these furnaces is shown in Fig. 4, and each furnace is equipped with a Bristol pyrometer. The iron baskets which serve to hold the cartridge cases are seen plainly, as the workmen are in the act of drawing out a basket.

As the trucks are wheeled beside the furnaces, men unload the cartridge cases from the boxes into the iron baskets and put these baskets of cartridge cases into the furnaces at the opposite end to that from which they are removed. The temperature at which the cartridge cases are annealed immediately after cupping is 650° C., or 1,200° F. They are left in the furnace for thirty-five minutes. They are then pulled out by long bars with hooks on the ends. An air hoist next picks up the basket and conveys it to a tank of water, where it is immersed and cooled.

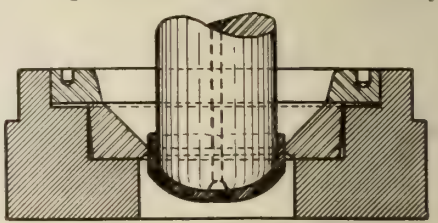


FIG. 2. CUPPING DIES.

It may here be said the effects of the annealing are in no way lost by the rapid cooling of the brass. It is, therefore, of no special benefit to cool the cases slowly, and thus, as time is one of the greatest factors in this work, the quick cooling by the immersion in a tank of water gains time and facilitates the rapidity of production. The annealing, of course, leaves a certain amount of scale on the case, which must be removed before any drawing operations are done, as this scale would ruin the punches and dies very quickly. In consequence, the fourth operation is to place the cases in an acid bath, which consists of a weak solution of muriatic acid. The shells then pass on to a hot bath of water in which some washing soda has been introduced. This latter bath removes all traces of the acid and leaves the metal clear of scale. After each annealing operation a similar wash must be given the cartridge cases.

### First Drawing Operation.

The shell now passes to the fifth operation, which consists of the first of a series of six drawing operations. This first drawing operation is done on the same Williams & White bulldozer as is shown in Fig. 1. The two outside

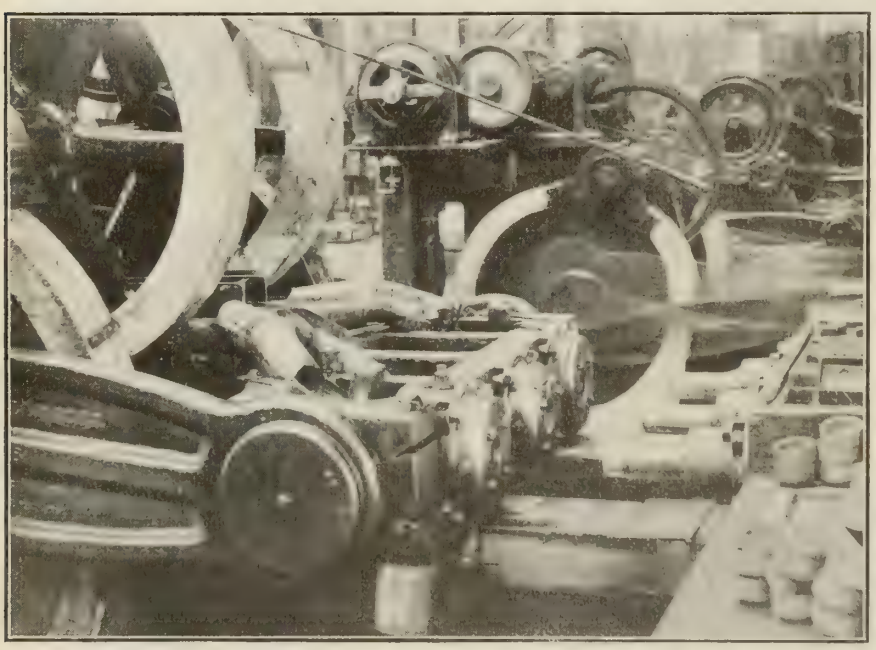

FIG. 1. BULLDOZER WITH THREE SETS OF DIES AND THREE PUNCHES FOR CUPPING AND MAKING THE FIRST DRAW ON 18-PDR. SHRAPNEL SHELL CARTRIDGE CASES. NOTE CONVEYER TUBES FOR CARRYING CASES TO REAR OF MACHINE.

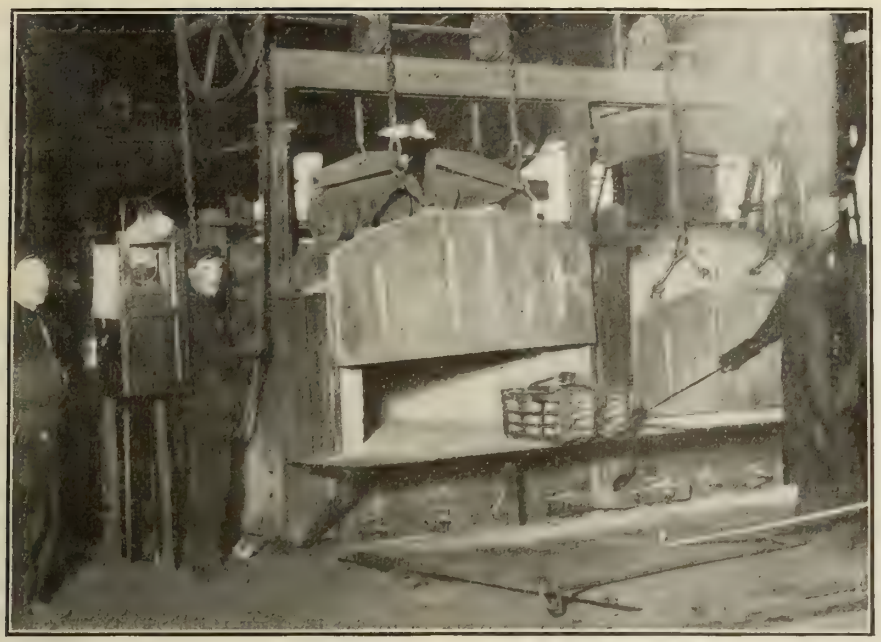

FIG. 4. FURNACE IN WHICH CARTRIDGE CASES ARE ANNEALED. THE BASKET CONTAINING THE RED HOT CASES IS BEING REMOVED FROM THE FURNACE AFTER ANNEALING.

punches work into the drawing dies that accomplish this operation. The dies and punch are shown in detail in Fig. 5, the dies being bevelled to an angle of 15° only to admit the case. By referring to Fig. 3, the size of the case and its shape can now be seen. The outside and inside diameters of the case are 4.31 inches and 3.873 inches respectively, while the over-all length is approximately 3.45 inches. Tallow and oil are placed on the work as lubricants, while the tools are copiously covered with soap and water. As in the case of the cupping operation, the punches push the cases clear of the dies and slide them into galvanized iron tubes, which convey them up to the wooden shutes at the rear of the machine. These shutes deliver the cases into boxes, which are placed on trucks and they carry them to the next operation.

### Sixth and Seventh Operations.

The sixth operation is the annealing of the cartridge cases again. Each drawing operation seems to rob the brass of its ductility, hence to restore this ductility and prepare the shell for the succeeding drawing operations the case must be annealed. The cartridge cases are placed on trucks and again carried to the blacksmith shop annealing furnaces. They are placed in similar iron baskets as before, and are annealed for a period of thirty-five minutes at a temperature of 650° C. or 1,200° F. As in the previous cooling operation, tanks of water are employed, after which the shells are carried back to the cartridge shop to have the second

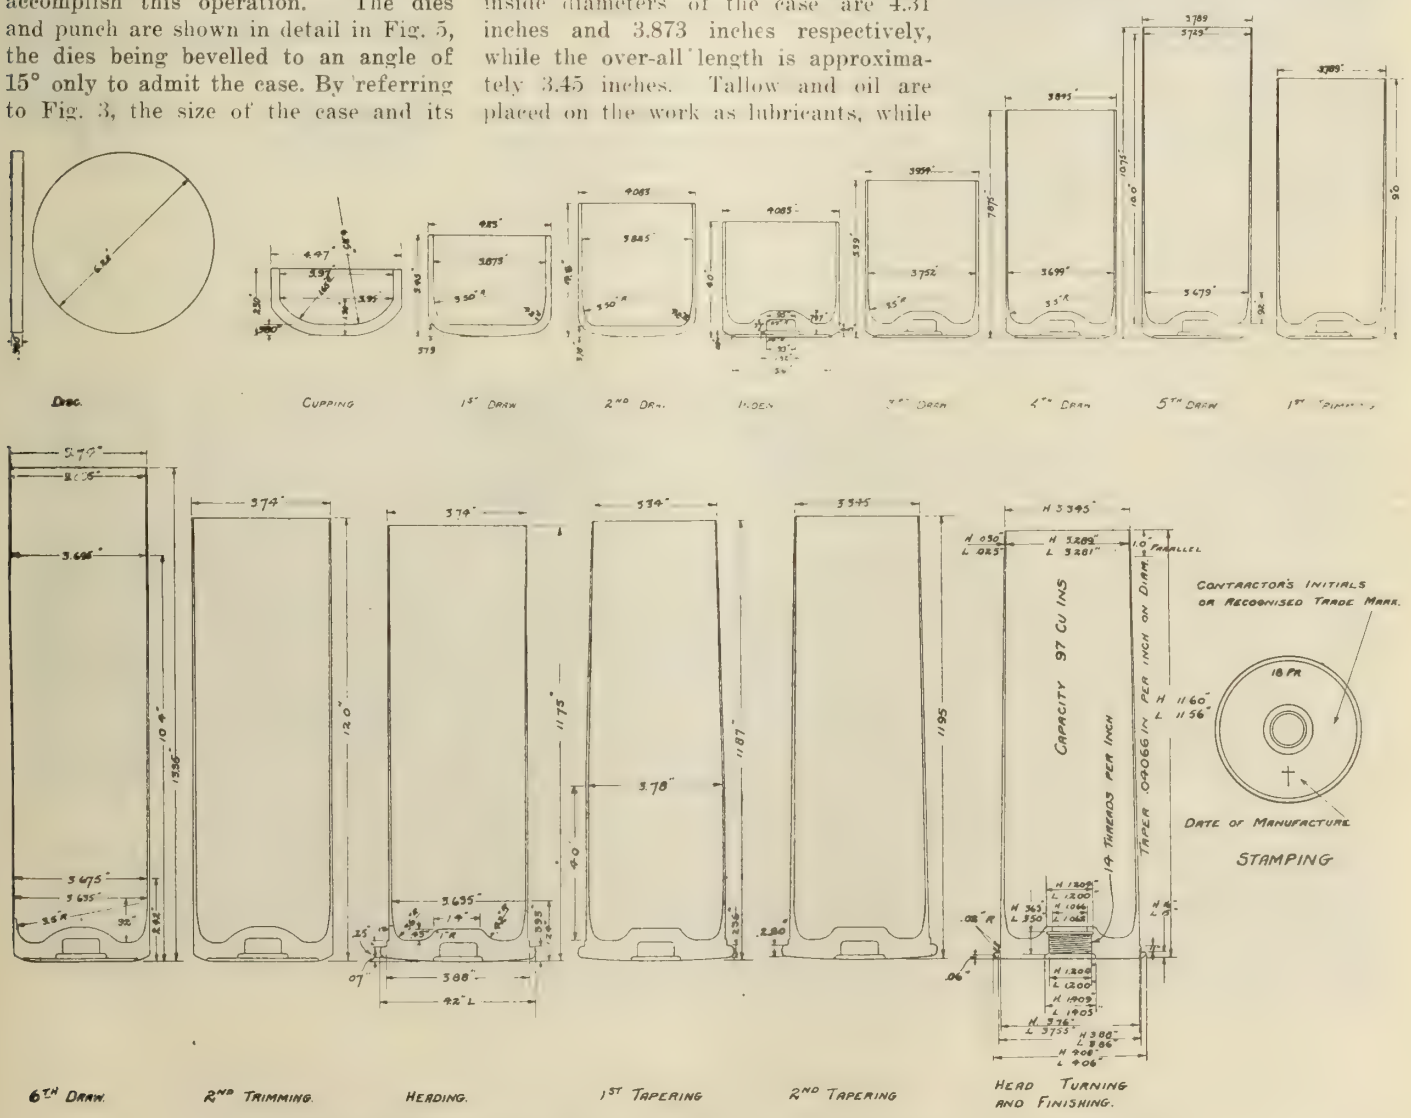

FIG. 3. CARTRIDGE CASE FOR 18-PDR. Q.F. IN ITS VARIOUS STAGES OF MANUFACTURE.

drawing operation accomplished after washing the cases. This drawing is done on a Williams & White bulldozer, but on a smaller machine than that on which the cupping and first drawing operations were done. The machine is, however, fitted up with dies and punches similar to those shown in Fig. 1. The details of the dies and punch are shown in Fig. 6. As will be seen here, these dies are also bevelled at an angle of 15° to facilitate the entry of the shell. The same lubricants as in the first draw are used. The case is so long now that stripping jaws have to be used to pull it from the punch. All of the cases are collected from the rear of the machine as before and transported to the blacksmith shop to be indented. The outside and inside diameters of the case are now 4.083 inches and 3.825 inches respectively, and the length is approximately 4.6 inches.

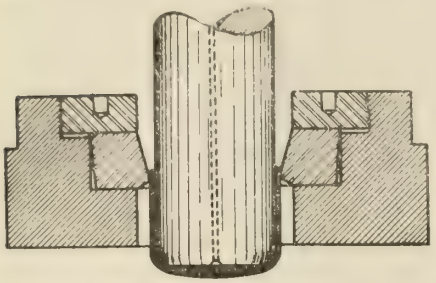

FIG. 5. FIRST DRAW.

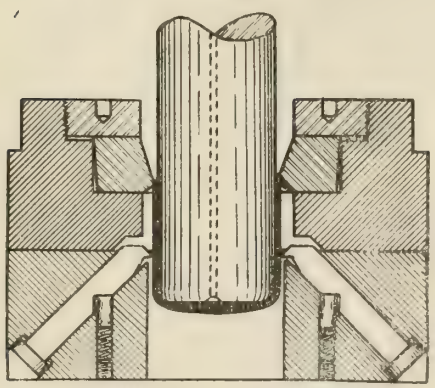

FIG. 6. SECOND DRAW.

### Indenting (Eighth Operation) and Annealing.

The next operation is that of indenting. It was formerly the practice to make a first and second indenting, but this idea has now been abandoned, and all is done in one operation. The work is done on a 500-ton hydraulic press, the pressure being obtained from a motor-driven vertical triple Aldrich pump. The pressure head on the delivery line is 1,500 feet, which corresponds to a little over 650 pounds per square inch. Water is pumped into a huge accumulator.

The details of the dies are shown in Fig. 7, while Fig. 8 shows the 500-ton press on which the indenting is accomplished. No lubricant is used on the dies or the case. The punch is held in the stationary portion of the press, and on the table attached to the ram are placed the dies. This table revolves, and is located for pressing at every quarter turn. The central die is pushed into position by a lever at the first position and is forced up into the cartridge case. As soon as this is done, the table is revolved by hand for one-quarter turn, and the moment the table revolves its stationary part comes under the central die and holds it in place. After a quarter has been traversed, a stop locates the table in position for another cartridge case to be placed in the dies. This done, another quarter turn of the table is made, and here the whole table is raised by the water pressure of the hydraulic ram. The punch causes the indentation to be made in the case. The table is now lowered and given another quarter turn, then raised again, thereby causing the cartridge case and central part of the die to be pushed out by a fixture on the stationary head of the press. The central portion of the die is passed on to be again placed in position to indent another case.

A case is placed in the dies, one indented and one pushed out every raise of the table, thus the press requires three men to operate it. One man places the cases in the dies, one man operates the water, and the third man takes the cases from the dies. Only one press is engaged in this work. The cases are next taken to one of the annealing furnaces and heated to 1,200° F. for a period of thirty-five minutes, and after cooling they are taken back to the cartridge shop, and are again drawn. The length of case has been reduced to approximately four inches during the process of indenting.

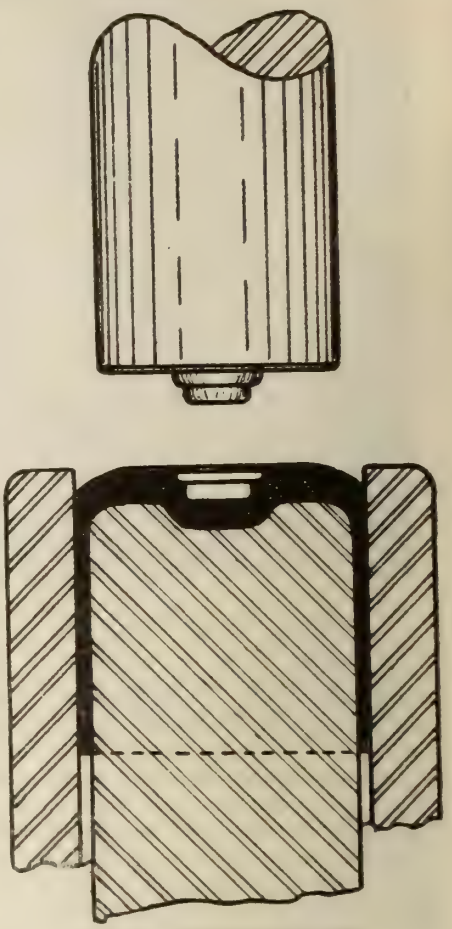

FIG. 7. INDENTING DIES.

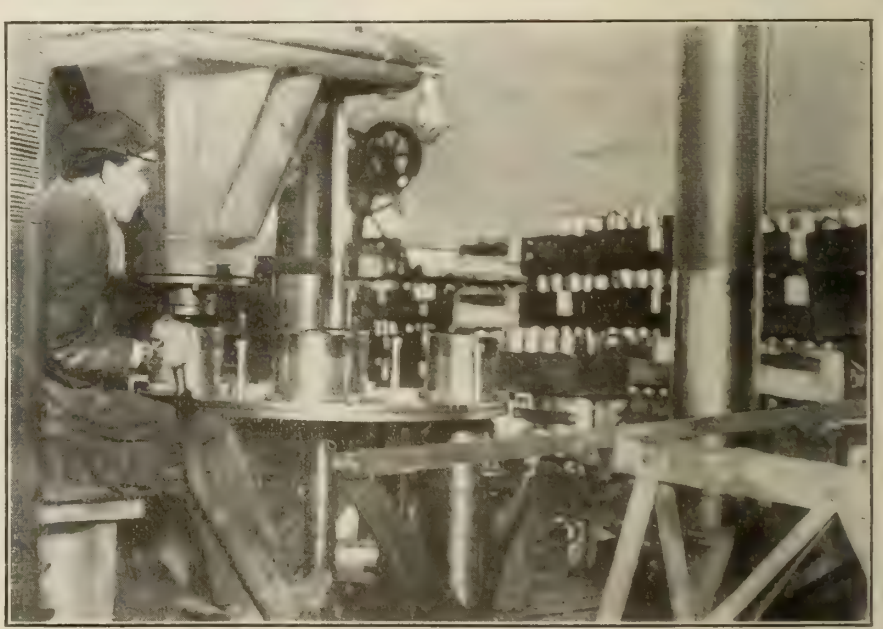

FIG. 8. INDENTING 18-PDR. SHRAPNEL SHELL CARTRIDGE CASES ON A 500-TON HYDRAULIC PRESS.

### Third and Fourth Draws.

The cartridge cases are now taken to a Williams & White bulldozer for the third draw, which is the ninth operation. The details of the dies and the punch for this are shown in Fig. 9. The

dies and punch are fitted to the bulldozer in much the same way as in the two previous drawing operations. Mineral oil and tallow are used on the case, and soap and water is placed on the punch and dies. These dies are equipped also with stripping jaws. The cartridge case outside diameter is reduced from 4.083 inches to 3.954 inches, while the length is increased from about four inches to approximately 5.39 inches. The inside diameter has also been decreased from 3.825 inches to 3.752 inches.

The shells are again taken to the blacksmith shop for the tenth operation, which is annealing, being again placed in the furnace and kept for thirty-five minutes at a temperature of 1,200° F. Once more they are brought back to one of the Williams & White bulldozers, on

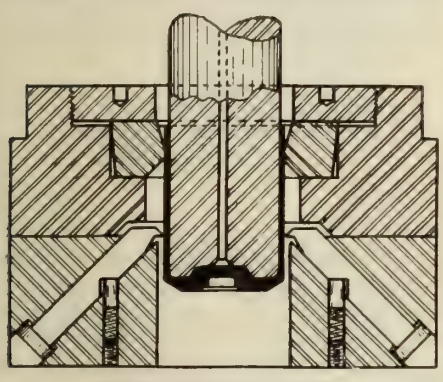

FIG 9. THIRD DRAW

which they undergo the eleventh operation or the fourth draw. The punch and dies, which are shown in Fig. 10, are again covered with soap and water, and the cartridge case is covered with tallow and oil. The outside diameter is decreased from 3.954 inches to 3.845 inches, and the inside diameter is decreased from 3.752 inches to 3.699 inches,

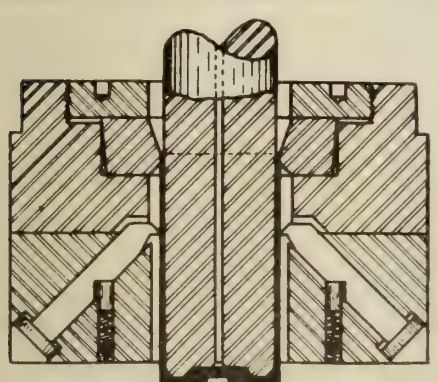

FIG. 10. FOURTH DRAW.

while the length is increased from 5.39 inches to 7.875 inches. The shells then go to the blacksmith shop to be again annealed for thirty minutes at 1200 degs. F. This annealing constitutes the twelfth operation.

### Fifth and Sixth Draws.

When the cartridge cases return from the blacksmith shop after having been last annealed, they are ready for the fifth draw or the thirteenth operation. The case has now become so long that the stroke required to accomplish these last two drawing out operations is greater than that of the bulldozers, so planers have been fitted up to do this work. Figs. 11 and 12 show two views of the punch and dies fitted to a Bertram standard type planer. The details of the dies and punch are shown in Fig. 13. The diameter of the cartridge case outside is here reduced from 3.845 inches to 3.789 inches, while the inside diameter is tapered. After the fourth draw, the inside diameter was 3.699 inches for the whole depth, and after the fifth draw the inside diameter is 3.679 inches at the bottom and 3.729 inches at the mouth. The length of the case is also increased from 7.875 inches to 10.75 inches. The case is

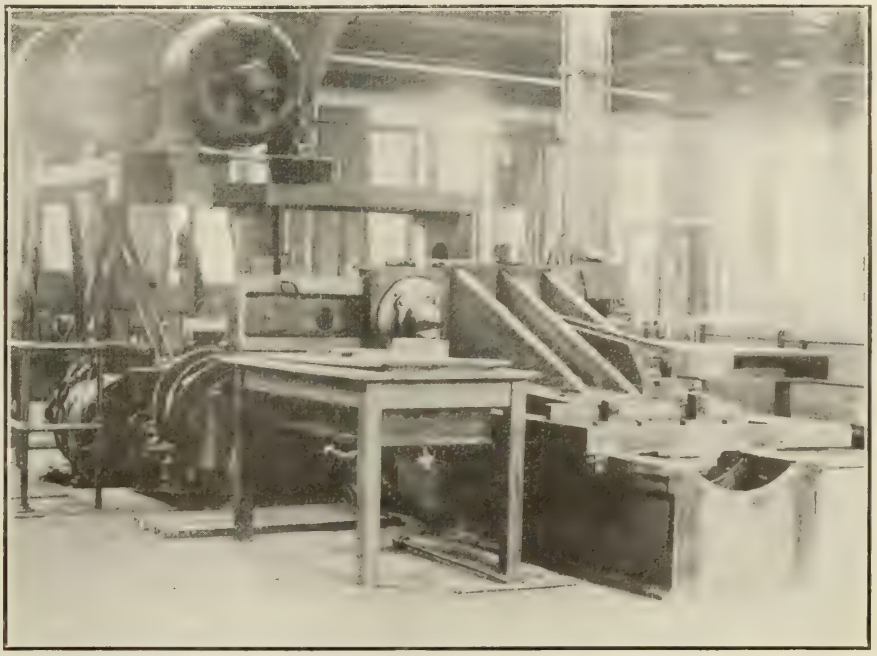

FIG. 11. FIFTH DRAW OF 18-PDR. SHRAPNEL SHELL CARTRIDGE CASES ON A "BERTRAM" PLANER.

given a bath of tallow and oil just previous to being put on the punch, while the punch and dies are lubricated with soap and water. The cartridge case now passes on to the fourteenth operation where it is trimmed by little motor driven circular saws to nine inches length. The trimmed ends are collected and pressed in a hydraulic press into bales and are sold to scrap dealers.

The fifteenth operation consists of annealing for thirty minutes in the oil

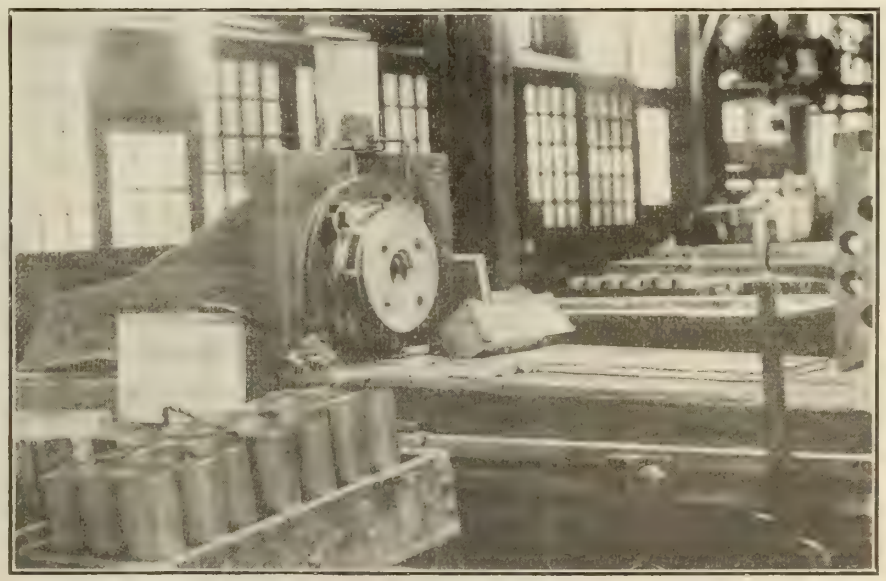

FIG. 12. FIFTH DRAW OF AN 18-PDR SHRAPNEL SHELL CARTRIDGE CASE ON A "BERTRAM" PLANER.

furnaces in the blacksmith shop, at a temperature of 1200 degs. F. The shells are then returned to the cartridge shop

for the sixth draw which is the sixteenth operation. This draw is also accomplished on Bertram planers with the same lubricants. The outside diameter is now reduced to 3.74 inches, while the inside diameter is shown clearly in Fig. 3. There are two tapers on the inside. The length of the case has been increased

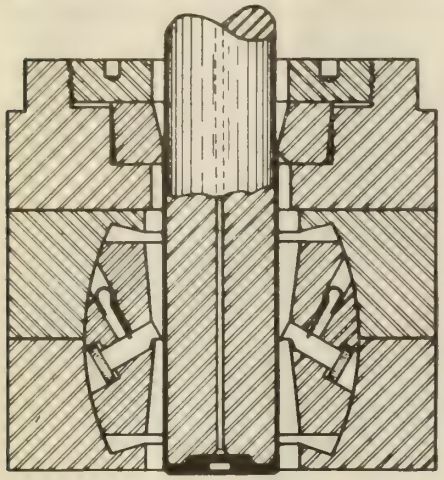

FIG. 13. FIFTH DRAW.

to 13.35 inches in this operation. Details of the punch and dies are shown in Fig. 14.

The seventeenth operation consists of trimming the shell down to 12 inches length, after which it is cleaned in caustic acid and dried in sawdust.

### Heading.

The shells are again taken to the blacksmith shop where two 800-ton hydraulic presses are fitted up with dies and punches to do the heading, which is the eighteenth operation. Fig. 15 shows one of the presses. There are four sets of dies on a revolving table, which is pulled around by hand, and locks at every quarter turn. The machine requires three operators. The cartridge cases are first tried over a plug gauge and then into a ring gauge to see if the bodies are within the proper limits to fit the dies. When this test is passed a case is placed in the dies, and with a quarter turn of the table it is placed under the heading punch. The next quarter turn brings it from under the punch, and the third quarter turn brings the dies over a hydraulic piston which ejects the case from the dies. This hydraluic piston thrusts the cartridge case upward until it is grasped by the jaws, which are shown clearly in Fig. 15. The hydraulic piston ram is also clearly seen. No lubricant is used in the heading process. The cartridge cases are now shortened from 12 inches to 11.75 inches, and the shape of the head is seen in Fig. 3. After this the cases are returned to the cartridge shop.

### Semi-Anneal and Tapering.

The nineteenth operation is to semi-anneal the cartridge cases in a gas furnace built in the shops. This furnace is clearly seen in Fig. 16. There are eight holes into which the cases are placed mouth first. They are left there for thirty-five seconds only, and then pass to the twentieth operation which is tapering in two stages on a William & White bulldozer. Two sets of dies are placed on this machine, and two operators are required. The first operator receives the cartridge case after it comes from the semi-annealing and places it on the first set of tapering dies. With the return stroke of the bulldozer, the shell is taken out and placed on the second tapering dies, after which it is removed. Neat's foot oil is used as a lubricant in this process. The tapers are clearly shown in Fig. 3, also the accompanying elongations.

### Machining.

The twenty-first operation is the machine finishing of the cartridge case and all the operations can be accomplished with one setting on one machine which is a special Bullard turret lathe. The operations required are shown in the

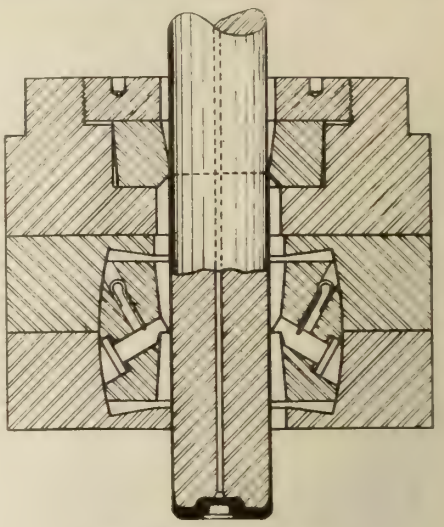

FIG. 14. SIXTH DRAW.

chart on Fig. 3. A turret is mounted on the lathe, and the lathe is equipped with a hollow spindle and a special type of friction chuck. The mouth of the cartridge case extends through the headstock, and a boring tool is mounted on an extension of the lathe bed. The cartridge case is trimmed to 11.60 inches in length and then for a distance of one inch it is bored parallel by this tool. The diameter is then tested by means of a limit plug gauge. The operation trues up the inside of the case for the reception of the shell. The specifications do not allow of any extensive process of boring, as it is thought that perhaps a manufacturer may be tempted to substitute a brass casting for a drawn cartridge. One operator looks after this operation. The second operator, meanwhile, is machining the head.

Fig. 17 gives an idea of the turret tooling on these machines. There is fitted to the cross-slide a tool which faces the end of the cartridge case, and on completing this operation, as the cross-slide is fed further in toward the centre, other tools are brought into the work which turn the various diameters shown in Fig. 3 at the head of the cartridge. All tools approach the work from the near side, and the cartridge case is chucked against a stop and the carriage is locked to the lathe bed. The cross-slide

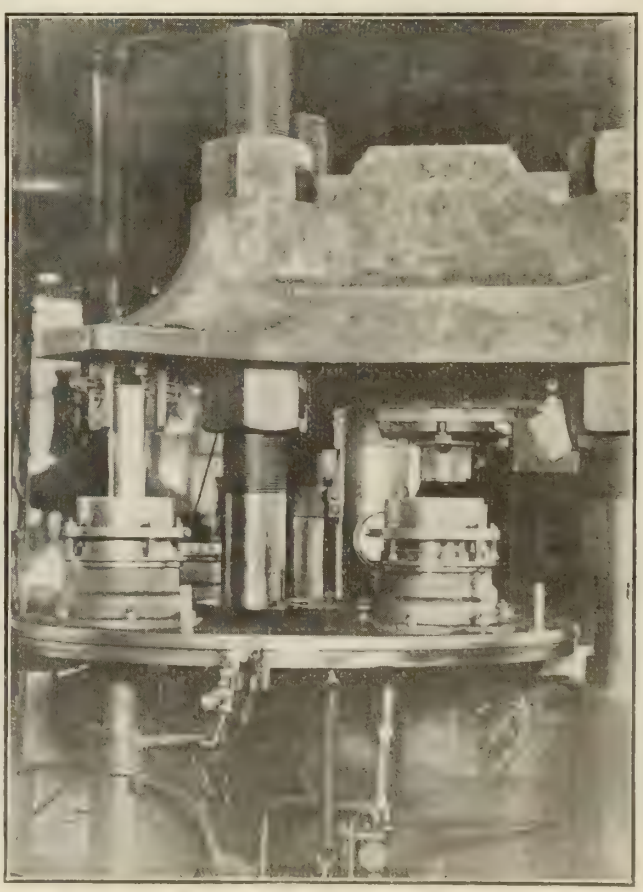

FIG. 15. HEADING IS PER SHRAPNEL SHELL CARTRIDGE CASES ON AN 800 TON HYDRAULIC PRESS.

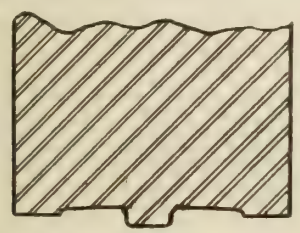
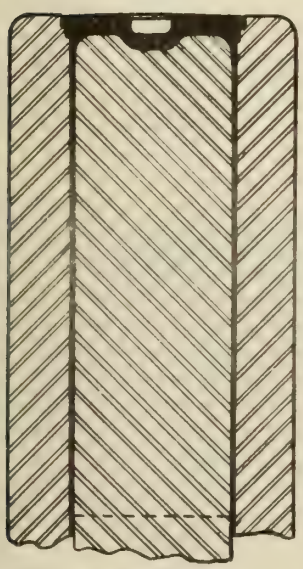
Note at the left foreground the small hydraulic ram which forces the cartridge case out of the dies and also the little jaws which hold it up from the dies as they return to their normal position.

is fed inwards until it is against a stop, hence the machine is almost fool proof. After these operations, the turret tools are fed into the work.

The first tool is a twist drill of several diameters which is fed into the end of the case, and when this tool has been fed in the proper distance a stop indicates same to the operator. The next is a little tool on a boring bar which is placed in the hole just bored. The turret is placed up against a stop and then the tool is fed into the work laterally by means of a cam in the boring bar, which cam is actuated by the little lever shown in Fig. 17. This tool is so ground that it cuts the undercutting groove shown in





HEADING DIES.

Fig. 3, and faces the inside of the hole. The proper depth of the groove is determined by the cam which causes the tool to have cut the groove to the proper depth when the high spot of the cam is pressed against the tool. The next tool is a collapsible tap which taps the hole. Finally a solid reamer is put into the work and this tool completes the series of operations. Soda water is used as a cutting lubricant. As it was not possible on short notice to get the required number of these special Bullard lathes, all the machining is not accomplished on them, several turret lathes having been tooled up to finish the heads of the cartridge cases as well.

Cartridge cases so finished have to be trimmed and have their mouth bored on a separate machine. They are simply chucked in a long jaw collet chuck and gripped firmly enough to resist the tendency to turn with the boring tool and at the same time not be sprung out of shape. These lathes are usually hollow spindle machines, and a hand-wheel on the end of a rod is used as a medium to open and close the jaws of the collet chuck.

Fig. 18 shows a Warner & Swasey turret lathe tooled up for finishing the heads of the cartridge cases. As will be seen, the facing tool on the cross slide approaches from the far side while the turning tools are on the near side. The cartridge case is chucked in an internal expanding collet chuck mounted in a cast iron casing which is screwed to the live spindle of the lathe. This cast iron casing is very long, as the whole length of the case has to be gripped, and the outer end is supported in a bearing which is bolted to the ways of the lathe. The shell is chucked against a stop, and, as the facing tool is fed into the work, the cartridge case is faced to length. The carriage is, of course, locked to the lathe ways. Thus, when the cross slide is moved so as to bring the turning tools into the work, these tools enter the work at the proper position. The cross slide comes against a stop when the proper diameters have been turned. The next

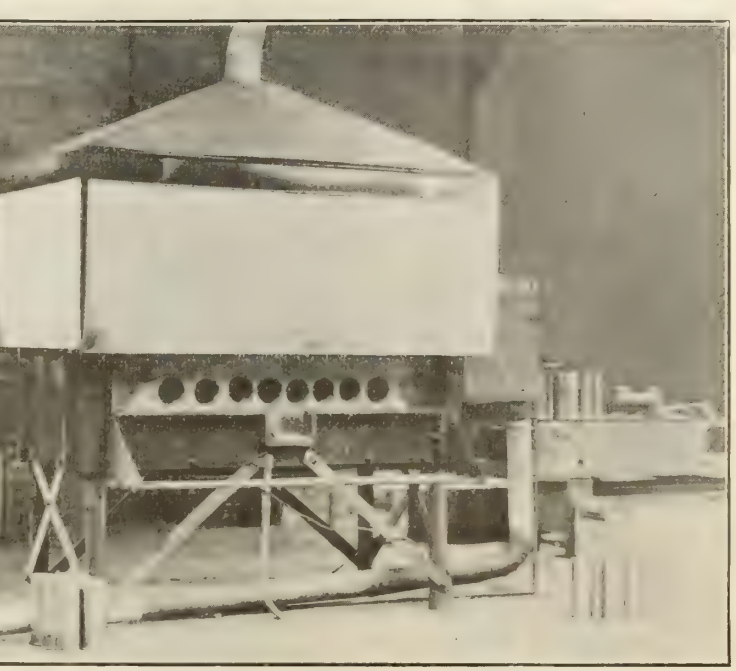


FIG. 16. GAS FURNACE FOR SEMI-ANNEALING 18-PDR. SHRAPNEL SHELL CARTRIDGE CASES PREVIOUS TO TAPERING.

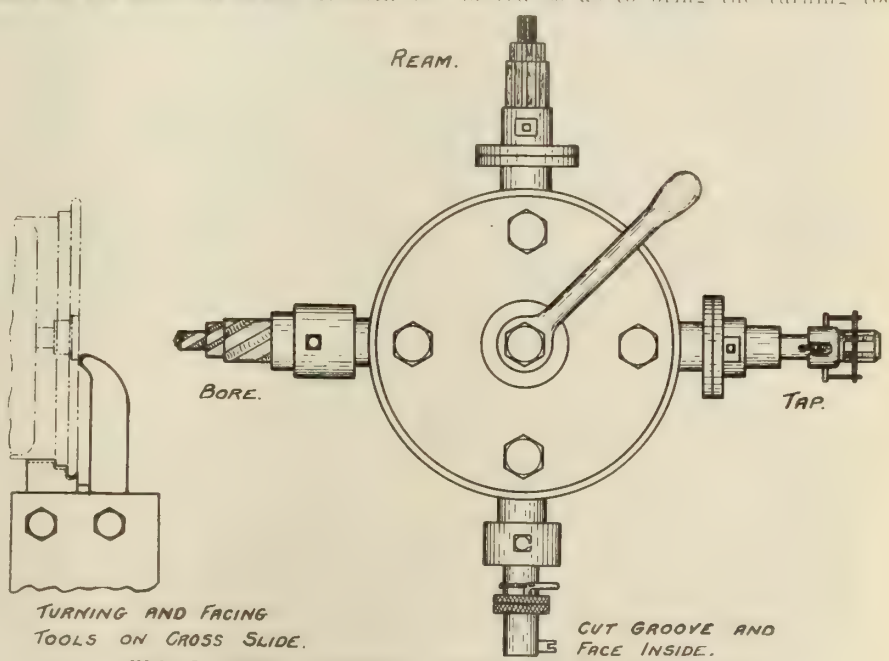

FIG. 17. TOOLS ON SPECIAL "BULLARD" TURRET LATHE.

operations are accomplished by the turret tooling, a diagram of this being shown in Fig. 19.

On the first boring bar there is a twist drill, which bores the rough hole, and the next boring bar carries a flat drill which has several diameters and finishes all the counterbores. Next the inside facing and grooving tool is fed into the work, this being the same tool as was fitted to the Bullard turret lathe. Another boring bar carries the collapsible tap, which is followed by a solid reamer. After this the cartridge case is tested for length with a limit gauge. The thickness of metal at the ends is also tested, together with the inside and outside diameters, the latter by means of plug and ring gauges. The taper is tested with the gauge shown in Fig. 20.

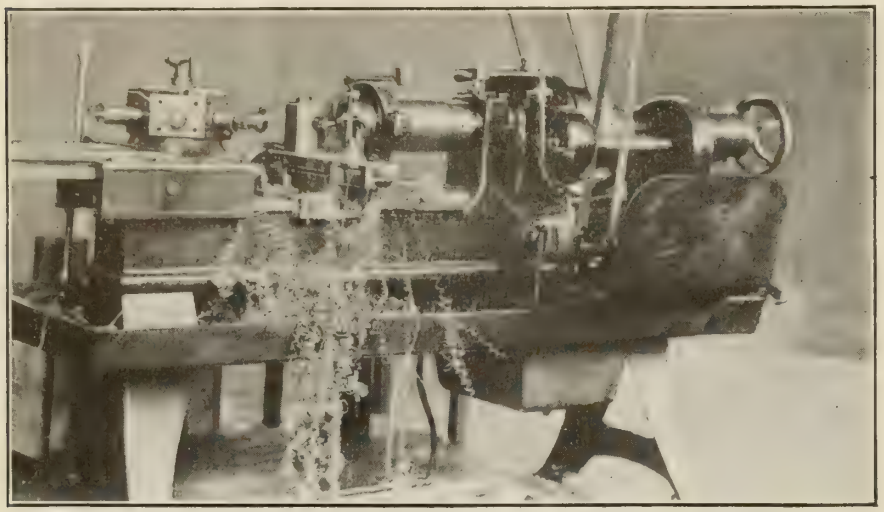

FIG. 18. FINISHING BACK ENDS OF 18-PDR. SHRAPNEL SHELL CARTRIDGE CASES ON A WARNER & SWABEY BRASS TURNING TURRET LATHE.

**Finishing on the Bench.**

The twenty-second operation is the final testing on the bench. Here the cartridge cases are placed in vises, and a finishing tap is run through the hole in the head. This tap is shown at A, in Fig. 21, which illustrates the gauges and tools used in the bench work. Next, the gauge B is placed in the hole at the head to see if the outer counterbore is of the proper diameter and depth. If it is not right, the hand reamer is used to correct it. Next the tapped hole is tested to ascertain if it is concentric with the counter-bore, tool D being used for this purpose. The low limit size thread is at the same end of the gauge as the flange, while the high limit size thread is at the opposite end. If the tapped hole is not concentric with the counterbore, the tap is placed in the hole and the reamer E is placed over the tap, and the counterbore is reamed out concentric with the tapped hole. The plug gauge F shows the high and low limit size of the hole in the socket. The low limit must pass through the hole, and the high limit must not.

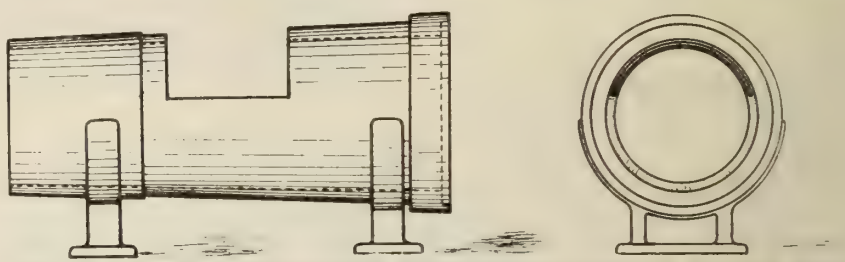

FIG. 20. JIG FOR TESTING TAPER AND OUTSIDE DIAMETER OF BACK ENDS.

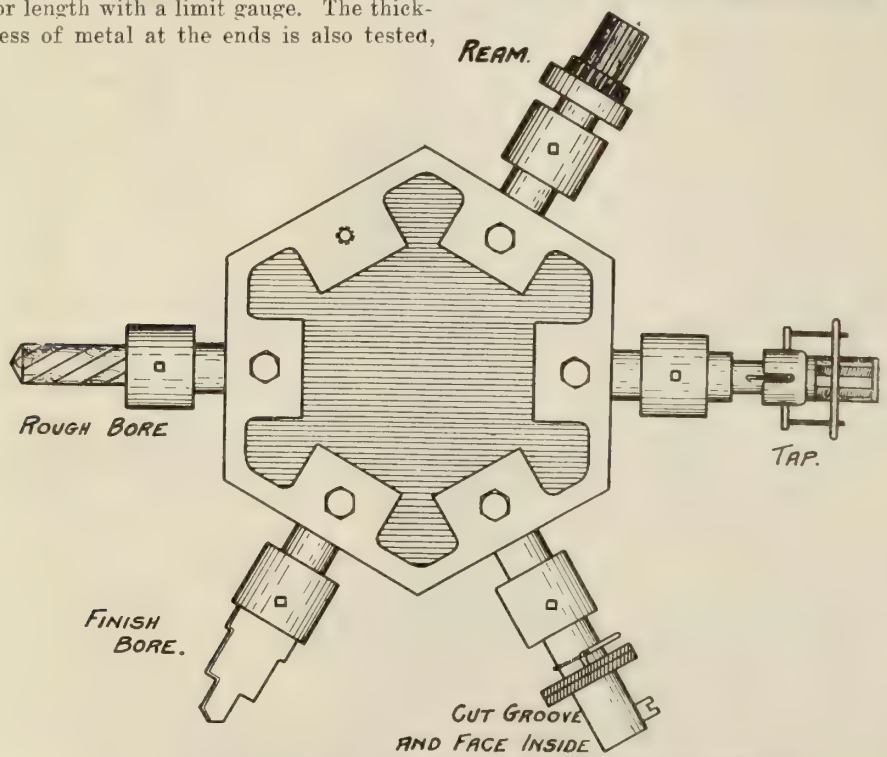

FIG. 19. TOOLS CARRIED ON THE WARNER & SWASEY TURRET.

**Stamping, Cleaning and Sand Blasting.**

The twenty-third operation is to mark the shell as indicated in Fig. 3, after which the shell is taken to a lathe which has a brass casting screwed on the live spindle. The casting is turned down on the end opposite the head stock. This shank has a thread cut on it to accommodate the tapped hole in the head of the cartridge case, the latter being screwed up against the large solid shoulder of the main casting and held solidly there while it is cleaned up. The twenty-third operation is sand blasting, which prepares the cartridge case for the final operation of black lacquering the inside. This completes the series of operations on the 18-pdr. shrapnel shell cartridge case.

**The 4.5 Howitzer Cartridge Case.**

The howitzer cartridge case is very much shorter than the shrapnel cartridge case, but the general line of manufacture is much the same. They are annealed in the same furnaces and at the same temperatures as the shrapnel cartridge cases. Fig. 23 shows the complete series of operations, while Fig. 22 shows the Williams & White bulldozer on which all of the four draws are accomplished. The dies and punches are changed to suit the operation. In Fig. 22, the bulldozer is cupping the discs, and the operator is sliding in a disc. The shortness of the case enables all draws to be made on a bulldozer.

The indenting and heading operations are accomplished on hydraulic presses in the boiler shop of the plant. The tapering is done in two stages on one Williams & White bulldozer.

The semi-annealing is accomplished by a very simple gas burning arrangement. Two vertical spindles carry two discs on their ends, and bevel gears from a pulley driven shaft, revolve the two vertical spindles. A circular pipe with holes drilled on its inner side forms the gas burner. Thus the cartridge case is annealed, by being placed on the revolving discs. The machining of the cases, and the tools, fixtures and gauges are similar to those for the 18-pdr. shell case.

**General.**

At present the shop is not fully equipped and the organization has not been perfected, but the estimated production of the 18-pdr. shrapnel shell cases is 5,000 per day of 24 hours. About 4,000 Howitzer cases, it is expected will shortly be turned out during the same time. The shells are carried about the shop on Chapman Double Ball Bearing Company trucks, in boxes of twenty-five each. Trucks on standard gauge tracks take care of the inter-shop traffic.

The hardness of the brass must be within certain limits or it will not perform its duty when under fire; thus cases have to be sent to the military authorities to undergo a firing test. They have, however, proved to be up to all requirements, and with all the unavoidable disadvantages under which this shop is working, it has most assuredly scored a huge success. The greatest credit is,

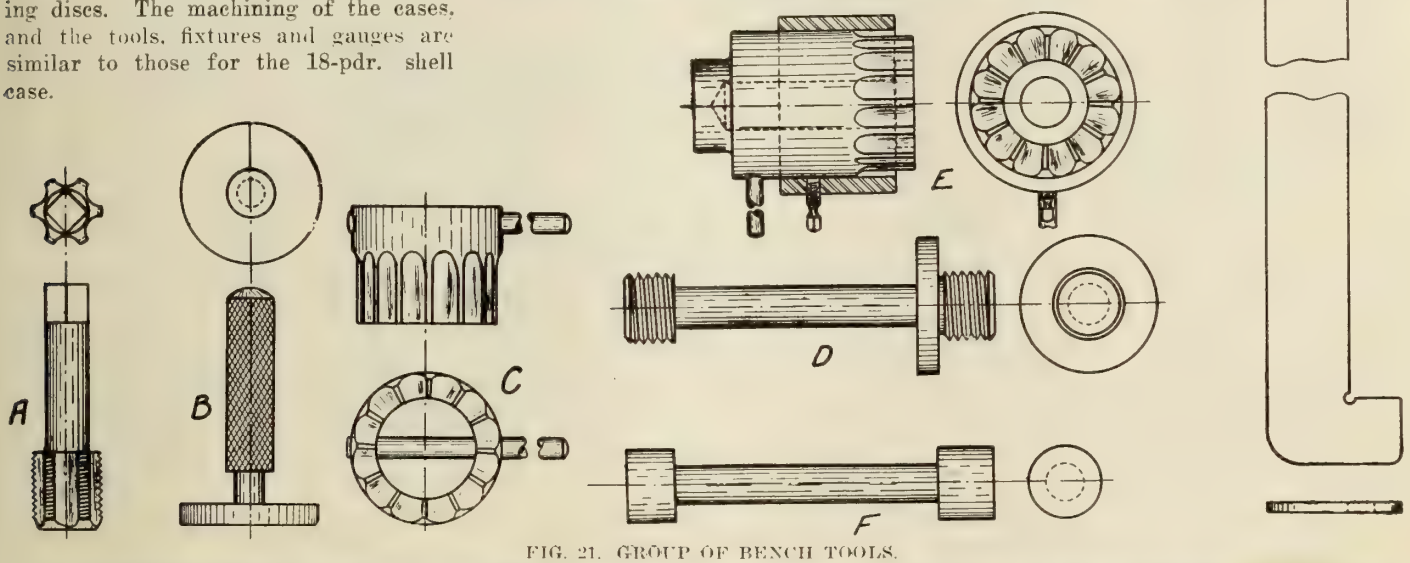

FIG. 21. GROUP OF BENCH TOOLS.

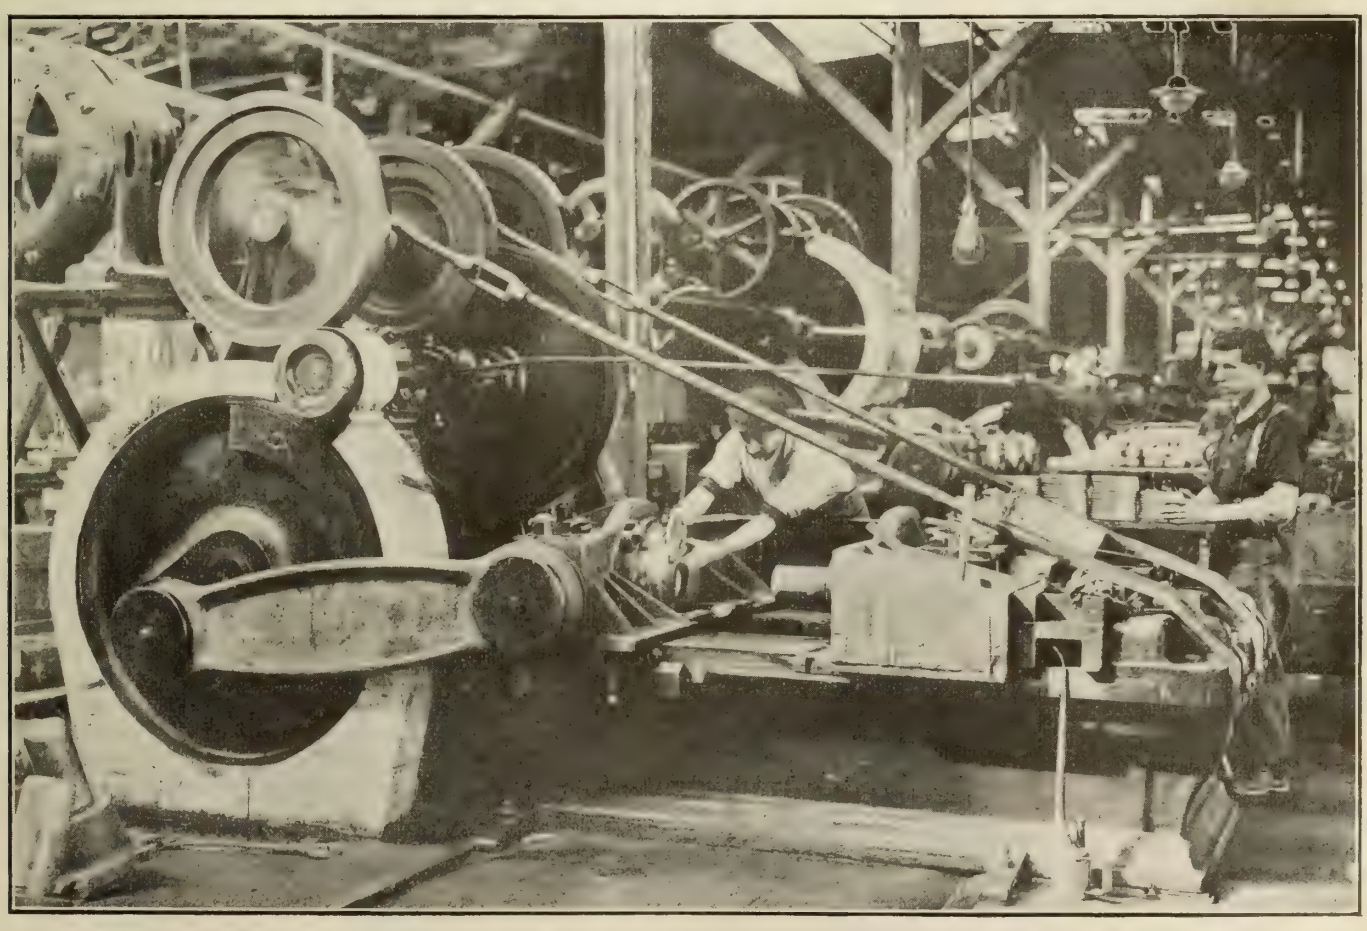

FIG. 22. CUPPING BRASS DISCS IN THE MANUFACTURE OF 4.5 HOWITZER CARTRIDGE CASES ON A "WILLIAMS & WHITE" BULLDOZER.

therefore due to its engineering department for their ingenuity, perseverance and patriotism.

While the layman's appreciation of the time, trouble and worry involved, and of the degree of success achieved, in such an undertaking as the manufacture of shrapnel and howitzer shell cartridge cases by means of equipment altogether foreign to the purpose—not to speak of the necessity of the latter's preservation against radical change in design and arrangement, may be such as to elicit the highest praise and create wonder and amazement, it really falls to the practical mechanical man to give the work being done its true rating. What we have here written serves in some measure to indicate this, but, to grasp the achievement in its fullness, warrants nothing short of one's presence at the scene of operations, and the following out of the processes from start to finish.

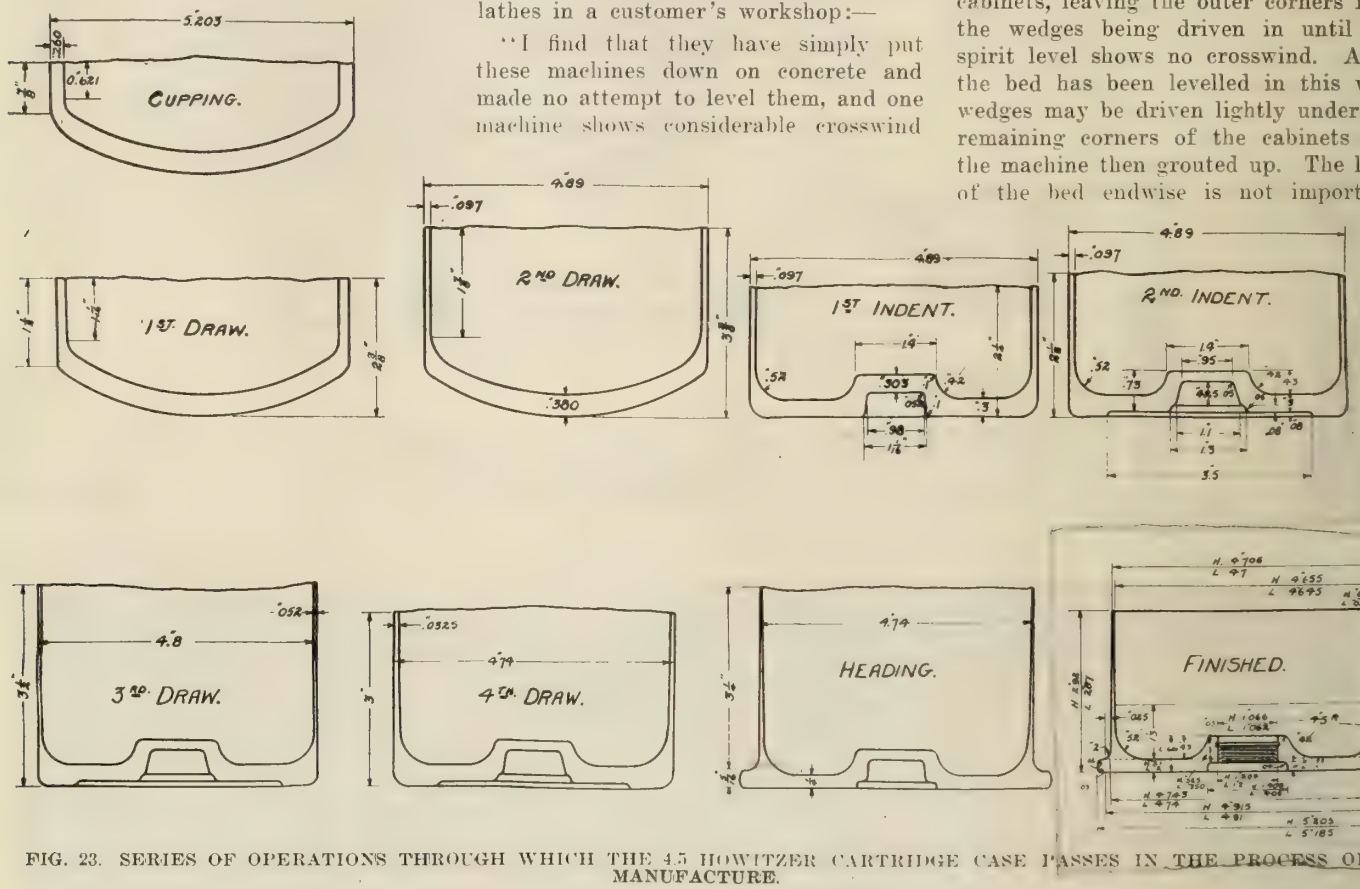

FIG. 23. SERIES OF OPERATIONS THROUGH WHICH THE 4.5 HOWITZER CARTRIDGE CASE PASSES IN THE PROCESS OF MANUFACTURE.

## LEVELLING-UP TURRET LATHE BEDS.

IN the current issue of Herbert's "Monthly Review," a short article is given upon the matter of levelling-up turret lathe beds—"a matter of vital importance to the turret lathe user if the machines are to turn out accurate work." What follows is intended to be supplemental and to give added emphasis to a previous article in the same publication, entitled "Hints on the Setting and Levelling-up of Capstan and Turret Lathes."

### Setting Level.

Even the stiffest lathe beds, whether for turret lathes or any other kinds of lathes, require to be correctly levelled if the machines are to turn and bore parallel. That this is a matter which frequently does not receive sufficient attention is shown by the following extract from a report by one of our expert operators regarding a number of turret lathes in a customer's workshop:—

"I find that they have simply put these machines down on concrete and made no attempt to level them, and one machine shows considerable crosswind in the bed. They complained of the machine boring taper and asked about moving the heads over. I told them not on any account to touch them until I could return, which would be as soon as possible."

This is typical of a number of experiences we have had of complaints that lathes would not turn or bore parallel or that turret tool holes were not in line with the spindle, and in nearly every case the cause has been the same namely, crosswind in the bed, due to the fact that the lathe bed had not been levelled. Turret tool holes are bored in position from their own spindles, the greatest care being taken that the beds are perfectly level. Reliable records are kept of the alignments of each lathe so that it is usually possible to quickly locate the cause of complaints when they are made.

### Testing and Inspection.

Our system of testing and inspection practically ensures that all lathes are in correct alignment when sent out, and it is never necessary to move a head sideways to correct a supposed error in the parallelism. The correct ways to level a bed is to use a delicate spirit level, which should be placed across the bed close to the headstock and in a similar manner at the right-hand end of the bed. The bed should be levelled by using iron wedges, driven in the first instance, under the inner corners of the cabinets, leaving the outer corners free, the wedges being driven in until the spirit level shows no crosswind. After the bed has been levelled in this way, wedges may be driven lightly under the remaining corners of the cabinets and the machine then grouted up. The level of the bed endwise is not important, the principal thing being to make sure that there is no crosswind.

**Shell Making on the Clyde.**—An important forward movement to increase the output of shells in Glasgow has just been commenced by the organization of lay labor. At least one clergyman has been working on the day-shift in a certain establishment for several weeks past, and now the members of the Citizen Training Force have come forward to lend their aid also. One company of the latter recently offered the already mentioned plant to keep sixty machines running throughout the night shifts, and, in accepting the offer, the directors suggested that only those engaged in clerical and other similar occupations during the day should be selected for the work of shell-making.

# Arithmetic for the Machinist and Workshop Operative

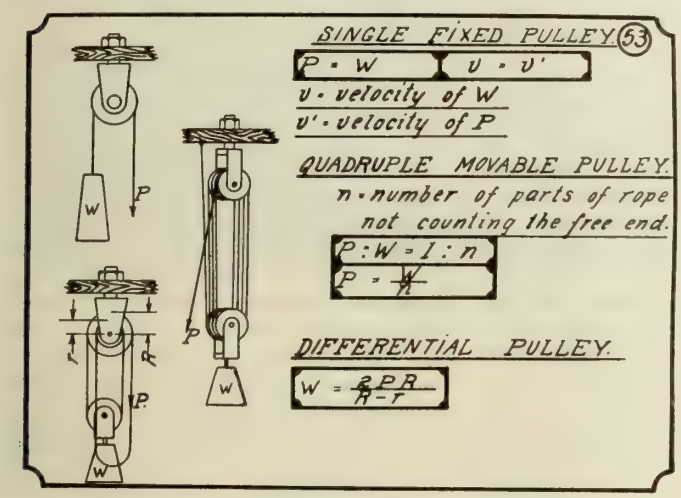
By J. H. Rodgers

*It will be found by those who have followed the previous lessons and profited by them that the various practical applications can now be easily observed, applied and appreciated.*

**LEVERS.—III.**

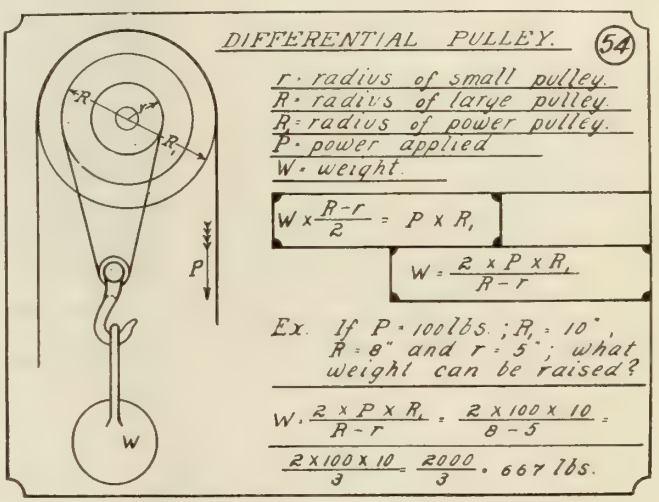
CHART 53 shows some applications of simple and compound levers, in use on the block and tackle. In the single fixed pulley, the pull on the free end P will equal the weight, as the power arm and weight arm are of equal length. In the multiple movable pulley where one continuous rope is used, the pull P will balance a weight W equal to P multiplied by the number of parts of the rope supporting the load, not counting the free end. In the sketch shown, if a weight of 480 lbs. be supported from the movable pulleys, what would be the pull upon the free end of the rope?

By formula:—$P = \frac{W}{n} = \frac{480}{8} = 60$ lbs.



SINGLE FIXED PULLEY. 53
P · W
v · v'
v · velocity of W
v' · velocity of P
QUADRUPLE MOVABLE PULLEY.
n · number of parts of rope not counting the free end.
P : W = 1 : n
P = W/n
DIFFERENTIAL PULLEY.
W = 2PR/(R−r)

ARITHMETIC CHART 53.



DIFFERENTIAL PULLEY. 54
r · radius of small pulley.
R · radius of large pulley.
R₁ · radius of power pulley.
P · power applied
W · weight.
W × (R−r)/2 = P × R₁
W = 2 × P × R₁ / (R−r)
Ex. If P = 100 lbs.; R₁ = 10", R = 8" and r = 5"; what weight can be raised?
W = 2 × P × R₁ / (R−r) = 2 × 100 × 10 / 8−5 =
2 × 100 × 10 / 3 = 2000/3 = 667 lbs.

ARITHMETIC CHART 54.

In the differential pulley shown, the weight is supported by two parts of the endless rope. Now, while the rope is winding up on the larger pulley, it is unwinding from the smaller; therefore, the velocity of W to P will be as one circumference to the other.

$$P \times R \times 2 = W \times (R-r), \text{ or } W = \frac{2PR}{R-r}$$

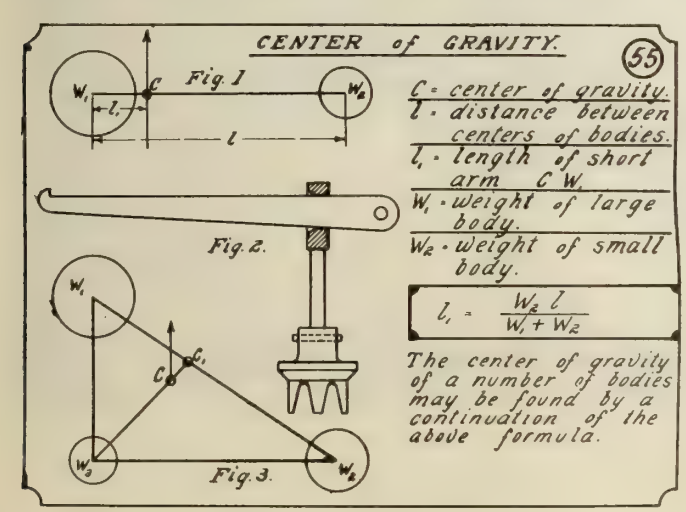
In the differential pulley shown on chart 54, a separate sheave pulley is used for the endless rope, or chain. The rope supporting the weight is similar to that on chart 53, winding on one drum while unwinding from the other.

If the drums supporting the weight are 18 in. and 15 in. in diameter, and the sheave pulley 24 in. in diameter; what weight can be raised by a pull of 100 lbs. on the rope P?

By formula:—

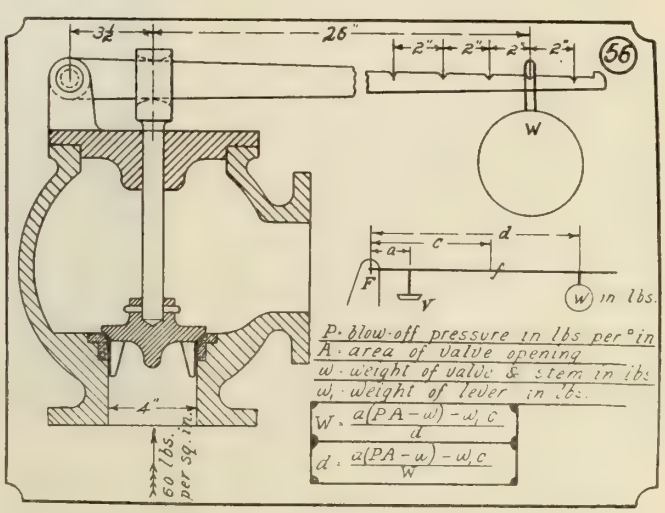
$$W = \frac{2PR_1}{R-r} = \frac{2 \times 100 \times 12}{9-7.5} = 1600 \text{ lbs.}$$

Where one or more forces act upon a lever, it is often necessary to concentrate their combined forces at a certain point for calculation. This point is called the centre of gravity of the various forces or bodies. The centre of gravity of a body is that point at which the body may be balanced if placed in any position.



CENTER of GRAVITY. 55
Fig. 1
Fig. 2.
Fig. 3.
C = center of gravity.
l · distance between centers of bodies.
l₁ · length of short arm C W₁
W₁ · weight of large body.
W₂ · weight of small body.
l₁ = W₂ l / (W₁ + W₂)
The center of gravity of a number of bodies may be found by a continuation of the above formula.

ARITHMETIC CHART 56.



ARITHMETIC CHART 55.

Two weights $W_1$ and $W_2$ are connected by a lever as shown by the sketch Fig. 1 in chart 55; at what point in the lever must the centre be placed to balance the weights?

To be evenly balanced, the moment of

$W_1$ about (c) (centre of gravity) must equal the moment of $W_2$ about (c), or the large weight $W_1$ multiplied by the short arm $l_1$ must equal the small weight $W_2$ multiplied by the long arm $l—l_1$.

Where would be the centre of gravity between two weights of 70 and 40 lbs. of 36 in. between centres?

By formula, chart 55

$$l_1 = \frac{W_2 l}{W_1+W_2} = \frac{40\times36}{70+40} = \frac{40\times36}{110} = \frac{144}{11}$$

13.1 inches from centre of large weight.

Proof:—$W_1 \times l_1 = W_2 \times (l—l_1)$, or $\frac{70\times13.1}{40\times22.9} = \frac{91.7}{91.6}$ which is approximately correct.

Fig. 3, chart 55 shows the method of finding the centre of gravity of more than two weights or bodies which is a continuation of the above rule.

In chart 56, what must be the weight of the ball W so as the valve will blow off at 60 lbs. per sq. in., the weight of the valve and spindle being 6 lbs., that of the lever 8 lbs.; centre of gravity of lever being 8 inches from the fulcrum?

By formula:—

$$W = \frac{a(PA—w)—w_1 c}{d} = \frac{3.5(60\times4^2\times.7854—14)—8\times8}{29.5} = 89.01$$

lbs.

Without taking the weight of valve and lever into consideration the weight of ball would be, from formula chart 49:

$$W = \frac{PL}{l} = \frac{754\times3.5}{29.5} = 89.4 \text{ lbs.}$$

## BOILER EXPLOSION AT SAW MILL, HUNTSVILLE, ONT.

ON Saturday morning, April 17, at 8.10 a.m., a disastrous boiler explosion occurred at the sawmill owned by Field Bros., in Sinclair's Township, twelve miles from Huntsville, Ont., resulting in the complete destruction of the mill and the instant death of George and William Field. An employee, named Prince, who left the mill a few minutes before the explosion, stated that he noticed about 20 pounds gauge pressure when passing the boiler to attend to some outside duties.

The exploded boiler was of the horizontal tubular type, 48 in. x 12 ft., containing 42 3 in. tubes. The shell plates were iron, made up in 4 courses longitudinally and 3 courses circumferentially. The first course was 5-16 in., and the others ¼ in. thick. Longitudinal steams were lap and single riveted with ⅝ in. rivets, pitched 1⅞ in., and circumferential seams had ⅝ in. rivets of 2¼ in. pitch. The heads were ⅜ in. thickness, and the segment above tubes was stayed by 6 ⅞ in. iron stays with crowfoot ends welded. The dome was of cast iron, minimum thickness 15-16 in., with manhole opening 13 in. x 17 in., and was secured to shell by 34 ⅝ in. rivets, the opening cut in shell was not reinforced. The boiler was built by a most reliable boiler manufacturing concern, but was at least 30 years old. The condition was found to be good as far as wasting and corroding was concerned, with the exception of around the blow-off opening, where the original thickness had been reduced to about ⅛ in. It will be seen in the photographs that the old style nozzle at blow-off was forced through the shell.

From information received from a brother of the deceased, who frequently visited the mill, the boiler was laid up last fall and had only been in operation a short time this season, and it was the custom to carry 80 pounds steam pressure. He also stated that the safety valve released then, but, for some unaccountable reason, pressure on the steam gauge could not be raised above about 20 pounds and steam continually leaked through the safety valve. The man in charge of the boiler hung a can on the safety valve lever and filled it full of nuts, bolts, etc., and this extra weight stopped the leakage for a while. When the valve started to leak again, a piece of wood 2 in x 4 in. x 3 ft., was obtained and securely fixed from the dome to end of safety valve lever, entirely stopping the leakage.

After the explosion, the steam gauge was tested and found to be in good working condition. The stop cock in syphon was, however, completely plugged, rendering the steam gauge inoperative, and the obstruction could not be dislodged with 300 pounds pressure, being the greatest test pressure applied at the time of this writing.

It may be gathered from the condition of the stop cock in syphon pipe that this obstruction was the direct cause of the excessive pressure on boiler, and that the safety valve was not leaking, but performing its duties very nicely, and had given warning that steam had reached the danger point, and that trouble should be looked for elsewhere.

The shell was torn along the top through the centre of dome and down to the longitudinal seam, shearing the rivets as shown. The front head was blown about 300 feet away and landed in a swamp. The rear head was blown in the opposite direction about 250 feet, out into the lake. The shell plates proper took a downward course, and flattened out but did not leave the boiler foundations. The safety valve was found on a hill about 300 feet away. The tubes with broken timber and debris were scattered within a radius of 300 feet. The explosion was the result of inexperience in operation. The boiler was second-hand, at least having been resold several times. The last sale was made shortly before the Steam Boilers Act came into force. Boilers sold or exchanged are now subject to Government inspection, and the inspections are made by inspectors from the Steam Boiler Branch of the Department of Public Works, Ont.

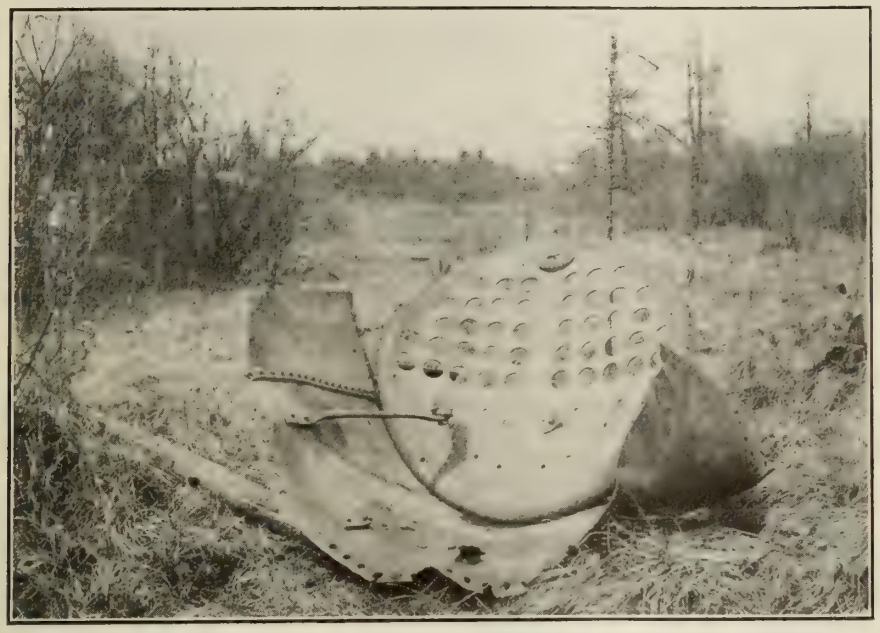
WRECKED SAW-MILL AND PART OF SHELL PLATING.

D. M. Medcalf, Chief of Province of Ontario Boiler Inspection Department, is standing at the left of picture.

### Coroner's Inquest Finding.

We hereby find that the deceased brothers George and William Henry

Field, came to their deaths in the Township of Sinclair, District of Muskoka on the seventeenth day of April, 1915, as



FRONT HEAD AND PART OF SHELL WHICH LODGED IN A SWAMP.

the result of an accidental boiler explosion due to over-pressure of steam, and we do not hold any living person or persons responsible for the accident.

## LUBRICATION OF TOOTHED WHEELS

ALL toothed wheels require lubrication of some kind upon their working faces. Where the pressure is light, liquid oil may be adopted, but moderately hard grease is required for heavy pressures. In this connection, the primary object is to avoid cutting or galling of the faces of the teeth. Incidentally, the lubricant acts as an elastic cushion and effects a notable reduction in the production of sound. Whatever lubricant is employed, it is important that it should be well applied to as much as possible of the working surface of each individual tooth.

In connection with main spur drives the best method frequently adopted is to apply the grease by means of a brush of suitable type while the engine is turned by the barring gear at a speed sufficiently slow to allow full application to each individual tooth throughout the full width of the working face from side to side of the wheel. For this purpose a large hand paint brush is a very serviceable tool. If the grease is normally too stiff for this method of application it may be softened by a gentle heat. The common method for most wheels is to apply the grease by means of a large brush when the wheels are running. By this means a very large proportion of the grease is at once thrown off and lost; also disfiguring and probably injuring foundations, walls, floors adjoining machinery and goods in process.

## ELECTRICITY IN ENGINEERING WORKS.

NO feature of industrial development during recent years has attracted more attention than the increase in the use of electrical power in engineering works. In shipyards and iron and steel works, and in many other manufacturing branches whenever any change in the lay-out of the plant or extensions to works have had to be made, the question of operating old or new shops electrically has received serious consideration. The cost of power for current purposes has come down to so low a level in many districts, and the applications of electricity have been so indefinitely extended, that older methods have gradually had to give place to the new aspirant for industrial honors.

The advantage has been a two-fold one. Threatened by the electrical engineer, the adherents of the steam engine have been compelled to search for improvements, and to effect economies of working, which it is safe to say would never have been achieved but for the stress of competition. The result is that the steam engine is a better servant than ever before, and that between a modern steam-driven installation and electrical operation there is often so little to choose that it is frequently a secondary point which decides the issue.

In the end, however, it is all narrowed down to a question of finance, and although the advocates of rival methods are often able to quote statistics showing the advantages of one system of operation over the other, each case has to be decided on its merits and in the light of local conditions.

## HEATING AND VENTILATION.

AT a recent meeting of The Society of Engineers (Incorp.), A. H. Barker, Wh.Sc., B.A., B.Sc., read a paper on some future developments in heating and ventilation. The twin sciences of Heating and Ventilation have received but little attention in their scientific aspects. The complexity of the factors that go to make up a given result, and the difficulty of defining in terms of exact science what that result is or should be, are reasons for lack of progress in the science of the subject, and, added to this, one has to take into account the variability of human physiology and psychology as an essential part of the problem.

Physiologists are not even agreed upon as to what is a healthy temperature for human beings to live in. The heating and ventilating engineer aims at producing comfort but is baffled by the fact that a man is comfortable only when he thinks he is. Air which, judged by chemical analysis, is impure may feel fresh and sweet, and vice versa.

The only legitimate function of the engineer is to produce and control specified movements of air and other effects, while it should be the duty of the physiologist and hygienist to specify what are healthy and comfortable conditions. In connection with heating, the expression "temperature of a room" is generally understood to mean the reading of a thermometer suspended in the room, but this reading does necessarily indicate the temperature of the surrounding air, or form a reliable guide to the feelings of the occupants of the room. The air temperature, the radiant temperature, the quantity of convected heat and the quantity of radiant heat must all be determined, but first the relation between the thermometer reading, the air temperature and the radiant temperature must be determined. The freshness of air in a building depends on keeping the air temperature relatively low and the radiant temperature high. The chemical composition of the air has, within wide limits, no effect on the human organism, whereas its temperature and humidity are very important.

The paper described experiments made at University College and the apparatus used in connection with them, and discussed briefly some problems which it is sought to solve experimentally.

**The Chapman Double Ball Bearing Co., Toronto,** have received a contract to supply the American Locomotive Co. with a complete equipment of trucks for handling shells in their plants at Richmond, Va., and Dunkirk, N.Y. The initial order is for over fifty trucks.

## RECRUITING OUR MECHANICS FOR BRITAIN.

COINCIDENT with the development of shrapnel and high explosive shell manufacture here in Canada, and arising also out of organized concentration in the Motherland to produce an output of these and other equally effective mechanisms, contrivances and engines of war to supply in full measure the most exacting requirements of our soldiers and sailors and their allied comrades, there has arisen a somewhat natural demand for mechanics, or, more specifically, machinists.

Figuratively speaking, the fiery cross is ablaze throughout the length and breadth of the British Isles and this Dominion of ours calling for enlistment to the ammunition supply column, and as a consequence, machinists of all ratings have little difficulty in finding employment, although due to the scope of the offerings they are perhaps relatively unsettled in determining what for them will ultimately have been the wisest course of action.

A machinist and a soldier are synonymous terms these days, each being the complement of the other, and at no time in the world's history has this particular fact been given such forceful expression or has its importance been so vividly portrayed. While it is something for all of us to be alive, so far, in this stirring time, and more so perhaps to be of such an age and sufficiently patriotic as to step out of our chosen routine and take the King's shilling, it is equally something to have acquired a trade and such a trade as will help to furnish the weapons and missiles with which our Empire soldiers and sailors may crush the enemy's bombast, rapine and tyrrany.

Just at the moment a rather interesting development is apparent in Canada relative to the recruiting and enlistment of mechanics for service in the production of munitions of war in the Old Country, and what surprises us in connection therewith is the easy equanimity with which our Government authorities take cognizance of the situation. They appear to be more or less flattered that an Official British Mission of Inquiry concerning armament labor is now in our midst with the avowed intention of securing machinists, including fitters, turners, millers, millwrights, etc.; riveters, drillers, shipwrights, including ship carpenters; boilermakers and boilermakers' helpers, sheet iron workers, coppersmiths, blacksmiths and blacksmiths' helpers, moulders, etc.

Little stir is in evidence (and as for alarm, oh no, because unthinkable), at our Departments of Trade and Commerce and Labor Headquarters, although several scores of our mechanics have already been shipped to Britain and many times more are in process thitherward. Do not the responsible heads of these Departments recognize that the production of shells and other munitions of war is equally important here as in England, and that the work can be equally as well and expeditiously performed. Besides, isn't it well that Canadian industrial enterprise be fostered and encouraged?

Our manufacturers, particularly those engaged in the production of shells, have not had nor are likely to have for some time to come, anything in the nature of a picnic in the planning and prosecution of the work entrusted to them. Difficulties have had to be met and overcome in the rearrangement of their peace-time equipment, in the securing of prompt delivery of additional machine tools, and in maintaining steady, continuous employment for their operators because of, in the first place, a lack of shell steel bars, and secondly because of a lack of shell forgings. Depletion of the labor market by allowing our skilled mechanics to go to Britain will perhaps more than all the foregoing, hit our engineering and metal working plant managements hardest.

We quite realize, that meantime neither our Government nor any Department of it may interfere with the liberty of our mechanics to choose for themselves what they shall do or where they shall go. We have neither got to the stage of martial law nor any other law which may make of us unwilling accessories, but we have reached the point at which a clear declaration should be forthcoming of the absolutely certain, and, as well, almost certain, war business which our craftsmen will not only get the opportunity to produce but will have to do so right here in at least the near future months, or, for that matter, while the war lasts. An idea is all too prevalent among our people, be it inspired or otherwise, that we are simply stopping the gap until the British plants be extended, ultra-equipped and definitely organized, and this feature is, we believe, more than anything else, responsible for the ease with which our mechanics can be constrained to leave our shores.

# The General Market Conditions and Tendencies

**This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.**

**Montreal, Que., May 31, 1915.**—Industrial conditions are somewhat improved, speaking generally, the improvement being due directly to the abnormal situation existing. War orders are being distributed much more largely than has been anticipated. The success which Canadian shops have achieved in machining shells is due largely to the ingenuity and determination displayed by the engineers of the various plants in handling the problem. Again, the forging of shell blanks is an industrial development arising out of the war which has also been taken up more or less extensively of late. Although there are few inquiries for steel for construction purposes, the shell business seems to be the channel through which a considerable tonnage is being disposed of. Steel interests are, however, very optimistic regarding the development of foreign trade. The machine tool trade and supply business continue very active, but pig iron is extremely dull and very little improvement is anticipated till the war is over. In the metals, spelter is about the only active specialty at present. There is a good trade in copper, but the prices have not been altered. In other metals not much change is reported. Tin has dropped some, but this was expected, due to the abnormally high price being asked.

### The Steel Market.

Although steel consumption throughout the province is considerably below that of a year ago, there is nevertheless quite a nice volume of business pasing at present. It is rumored that there is a possibility of larger shells being manufactured in Canada, and, if so, this will certainly increase the demand for steel.

Building sections are very quiet indeed, the building trade being apparently at a complete standstill.

Machinery bars are in fair demand, and tool steel is selling well, the movement in the latter involving bars and the finished product as well. Many special tools for shell work are being placed on the market by various concerns, and firms like the Armstrong-Whitworth Co., are making a large number of tools to special order for various shops who find out that the pressure of running for twenty-four hours a day leaves but little time to make tools.

There is a scarcity of steel in many British Colonies at the present time. Australia, India and South Africa are requiring considerable tonnage. Shortage of ships prevents the development of this over-seas trade. At the close of the war, however, it is felt that this trade will increase. It is not to be expected that ships will be available before the declaration of peace. It has been very gratifying to see more or less Canadian steel going over the U.S. border of late.

### Pig Iron.

The situation keeps unchanged from week to week, and from the outlook at present it will be rather hopeless to expect much alteration for the better for some considerable time to come.

### Machine Tools.

The demand for heavy-duty lathes in connection with the manufacture of the larger sizes of shells is now causing a scarcity on the market. Turret lathes have been in greater demand than ever before and deliveries at present are in excess of six months in many instances. Second-hand machines rebuilt and put in first-class running order are selling well, and are giving good service on shell work. Banding presses and nosing presses of various makes are being handled by most of the machinery houses. Hydraulic presses for forging are being installed in a large number of factories, thus adding to the number of forgings being produced. In other lines of tools, business is very quiet indeed.

### Metals.

The metal market is more or less active all the time, because of the continued development requirement. The demand for war munitions and the uncertain supply has of course contributed almost entirely to the fluctuations. The past week has not, however, brought as many changes as in some of the previous changes. Copper, after many weeks of activity, has been fairly quiet, although a good volume of business is passing and the prices are firm.

Tin has sagged off five cents per pound, and is now down to forty cents. This is still an abnormally high price, and if shipments continue to arrive from Europe and elsewhere, further reductions may be looked for.

Shortage of spelter has caused the price to soar to twenty-five cents. The British supply came formerly from the Continent, but since the outbreak of war has come largely from the United States; hence the high price.

Lead is a little higher in price, while antimony remains the same. Unusual demands for the latter have caused the price to have rather a tendency to stiffen.

Aluminum is a little easier in price and is now selling at twenty-three and a half cents.

### COMING CONVENTIONS.

**American Supply and Machinery Manufacturers' Association and National Supply and Machinery Dealers' Association, Hotel Bellevue-Stratford, Philadelphia, Pa. (Joint convention.)—June 3-5.**

**American Railway Master Mechanics' Association, Atlantic City, N.J.—June 9-11.**

**Railway Supply Manufacturers' Association. Convention and exhibit in conjunction with the Railway Master Mechanics and the Master Car Builders.—June 9-16.**

**Master Car Builders' Association, Atlantic City, N.J.—June 14-16.**

**Associated Advertising Clubs of the World, Chicago.—June 20 to 24.**

**American Society of Mechanical Engineers, Buffalo, N.Y. (Spring Meeting.)—June 22-26.**

**American Society for Testing Materials, Hotel Traymore, Atlantic City, N.J.—June 22-26.**

**American Foundrymen's Association, Atlantic City, N.J.—Sept. 27-Oct. 1.**

**Foundry and Machine Exhibition Co., Atlantic City, N.J.—Sept. 25-Oct. 2.**

---

**Toronto, Ont., June 1, 1915.**—General business conditions are showing some improvement, favorable crop conditions being responsible for a more optimistic feeling, however, the possibility of a protracted war is making everybody cautious in their commitments. The chief feature of interest in the engineering field is the satisfactory progress that is being made in the shell industry; the production is increasing daily and the output will soon reach large proportions. Less trouble is now being experienced through shortage of forgings as more presses are being installed to take care of the increasingly heavy demand. It is not however, certain that this trouble has been entirely eliminated as the number of machine shops engaged in the manufacture of shells is increasing all the time and require a large number of forgings to keep them busy. The Purchasing Commission which was appointed about three weeks ago is now installed in permanent offices at Ottawa and has already transacted a large volume of business. The commission will no doubt be a great benefit to trade and ensure greater efficiency and less wastage than formerly. It is announced that the Government will continue the construction of all Public Works under contract in Canada. This will minimise unemployment and also hasten the completion of works necessary for the development of the country.

### Steel Market

The shell industry continues to be the all-absorbing feature in the steel trade and the demand for steel bars and billets for lyddite and shrapnel shells respectively is rapidly developing. In fact, the supply has so far been inadequate but it is to be hoped that this will soon be remedied, otherwise the situation will become serious. Business in other lines is quiet. The building trade is dull and there is little inquiry for merchant bars. Galvanized sheets have advanced 25c per cwt. on account of the high price and scarcity of spelter. It is difficult to gauge the market on account of the general unsettlement, but the tendency is certainly for higher prices unless the spelter situation improves considerably, which at present seems highly improbable.

### Pig Iron

The situation remains unchanged and the market featureless. Indications point to a continuance of the present conditions for some time to come. Quotations are unchanged.

### Machine Tools.

The active demand for shell making equipments continues and is such that any available tool, new or second hand, is quickly snapped up. The situation as regards deliveries is serious and does not improve. Machine tool manufacturers are in many cases sold up months ahead and firms contemplating making shells are thus faced with the difficulty

of obtaining the necessary tools without delay.

### Supplies

The supply business continues very brisk and prices are holding very firm. Brass fittings may advance in price on account of the high cost of copper, spelter and zinc. Rope quotations are very firm and higher prices are within the range of possibility. There is a good demand for belting, cutting compounds, and high grades of tool steel.

### Scrap Metals.

Good business is reported in copper and brass scrap with a tendency to higher prices in both cases. The scrap iron and steel markets are quiet. Prices are unchanged and are given in the selected market quotations.

### Metals.

The feature this week is the continued rise in spelter due to heavy demand and shortage of supplies. Tin is unchanged but the market has a firmer tendency. The copper and antimony markets are quiet and unchanged but lead is showing greater strength. The large proportion of business passing is for those metals used for munitions, in other respects trade is quiet. The New York metal exchange was closed on Monday, being Decoration Day in the States.

**Tin.**—After a long dull period with a declining market there are indications of returning activity with higher prices for this metal., The market is quiet but firmer with an upward tendency. Local quotations are unchanged at 40c per pound.

**Copper.**—The copper situation is unchanged and the market is quiet. Production is on the increase and there are no indications of any falling off in consumption, although there is the possibility of some consumers having fully covered their copper requirements, in which case the demand would not be so heavy. Quotations are firm but unchanged at 21c per pound.

**Spelter.**—The extraordinary situation continues, the market being very unsettled and supplies of metal almost unobtainable. There is a heavy demand for spelter for all months up to the end of the year but sellers are offering sparingly and no large quantities can be bought. Quotations have advanced 6c and are nominal at 24c per pound.

**Lead.**—There is more activity in the lead market and the Trust has advanced prices in New York $2 per ton. Local quotations, however, are unchanged at 5¾c per pound.

**Antimony.** — The Market is a little more active after a period of comparative dullness. The situation is unchanged, the consumption being heavy and quotations nominal. Strength is being shown, but local quotations are unchanged at 40c per pound.

**Aluminium.**—The market is strong and entirely nominal. The price has advanced 2½c and is quoted locally at 26c per pound.

### CANADIAN GOVERNMENT PURCHASING COMMISSION.

**The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George Gault, Winnipeg; Henry Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.**

**St. John, N.B., May 29, 1915.**—Business conditions throughout New Brunswick continue to be satisfactory, with prospects at least for some time to come, decidedly encouraging to practically every branch of manufacturing endeavor. The winter-port season has closed in St. John, but it was most successful in its duration, and in the matter of exports there was a heavy volume of trade. War orders are keeping several factories busy, and in some cases there has been revived an extension of space to cope with the augmented trade. Lumbering is another branch in which there is much activity. The cutting and driving season has been satisfactory, and the majority of the big mills throughout the province are now sawing busily.

The big plant of the Chamcook Sardine Co., built not long ago at Chamcook, N.B., a thoroughly modern factory, is soon to be re-opened for operations, the business being carried on by the Lane, Libbey Fisheries Co. of Toronto. The plant has been idle for some time. It is probably the most up-to-date factory of its kind along the Atlantic seaboard, and the understanding is that it will now run in full time. The plant of the Leavitt-Seavey Co. at St. Andrews, a clam cannery, is busy with heavy orders.

MacKinnon, Holmes & Co. of Sherbrooke, Que., have been given the contract for the steel structural work on the handsome new building of four storeys to be erected in King street, St. John, by Scovil Bros., while the Otis Fensom Co., Toronto, have closed the contract for freight and passenger elevators.

### Railroad Extension.

The St. John Railway Co. have extended their lines into suburbs as far as Glen Falls, and a regular service has been established to this growing centre. The company and the city are at present at a deadlock with regard to the matter of pavement and the type of rails to be used in a leading avenue, Princess street, the city insisting on grooved rails instead of the "T" rails proposed by the company, and also asking for a permanent concrete base. No settlement has been arranged as yet, though the matter has been in dispute for nearly a week.

Several thousand dollars' damage is thought to have been done this week in a fire in the Atlantic Sugar Refinery here. The loss has not yet been estimated, but fire and water did considerable injury to the stock and some of the machinery.

### ALLIES PURCHASING AGENTS.

**The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:—**

**International Purchasing Commission, India House, Kingsway, London, Eng.**

**British.—Col. A. G. Barton and F. W. Stobart, Ritz Carlton Hotel, Montreal.**

**French.—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendance Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminister, London.**

**Russian.—Messrs. S. Ruperti and Aieksieff, care Military Attache, Russian Embassy, Washington, D.C.**

### DOMINION STEEL CORPORATION NEAR CAPACITY.

THAT the mills of the Dominion Steel Corporation are as active at present as during the busiest periods of its history, is the statement made by J. H. Plummer, the president. Operations are now being carried on at about 90 per cent. of the capacity of the entire works, and there are orders on the books of the company which assure operations to the same extent for at least the next four months. Business on normal Canadian account is, however, practically nil.

At the present time the output of the Dominion Steel Company is about as large as during the most active periods in its history. It should be explained, however, that the business is almost entirely for export, and therefore, not so profitable as domestic trade. The rail mills will presently begin rolling on the 35,000-ton order received for shipment to South Africa, while the steel required for the manufacture of 1,500,000 shells will mean at least partial opera-

tions of the bar mill for at least six months. Inquiries now being received give encouragement that further new business will develop in rails and other products in due course.

## CANADIAN PURCHASING COMMISSION IN HARNESS.

A SURVEY of the work of the War Purchasing Commission shows that within the brief time since their appointment by the Government, a mass of work has been accomplished in addition to the preliminary task of organization. The Order-in-Council appointing the Commission was passed on the 8th of May, and the commissioners were notified on the day following. Since then there have been fifteen working days, in which time the commission have selected and equipped their offices, organized their staff, and have awarded contracts involving hundreds of thousands of dollars. These contracts have been awarded by tender, and each has had, it is stated, the closest scrutiny of the commission. They have covered a very wide range of articles of clothing and equipment and of war supplies generally.

The commissioners, in addition to the staff organized by them, are having the co-operation of several branches of the Government service whose duties bear upon the work of equipping and forwarding the troops. The objects for which the commission has been created are to assist the various branches through which the war vote is expended, insofar as the purchasing of supplies, equipment, munitions and materials of war, transportation contracts, etc., are concerned.

The contracts awarded so far, to the lowest tenders in each case, have been for provisions, forage and supplies for all the camps and outposts where troops are training or are on duty, also equipment, surgical appliances, machines, tents, etc., for new hospitals in France, and so on. Large quantities of raw materials for the manufacture of ammunition in the Dominion arsenal, supplies for horse equipment, field telephones, and technical equipment for the railway engineering corps and dental equipment have been purchased and contracts have been let for the transportation of the troops.

The question of boots has also been considered, and an army boot has been turned out in which strength and flexibility are combined. The boot question has not been disposed of finally, but that now being supplied is believed by the commission to be the equal of, if not better, than those worn by the troops of the United Kingdom or their allies. The best advice that could be obtained has been taken in regard to the boots, and further suggestions from any source are being welcomed.

**Montreal, Que.**—The Thibault Laundry Co. plant has been destroyed by fire.

# Canadian Commercial Intelligence Service

**The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.**

# INDUSTRIAL AND CONSTRUCTION NEWS

**Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.**

## Engineering

**Orillia, Ont.**—The National Hardware Co. has secured a contract for 20,000 4.5 lyddite shells.

**Kincardine, Ont.**—The Hunter Bridge & Boiler Co. have received an order for 25,000 lyddite shells.

**Fredericton. N.B.**—The Smith Foundry Co. of this city has received an order for shells from the British Government.

**London, Ont.** — The Luitweiler Pump Co., 291 Dundas street, is in the market for a plant for the manufacture of pumps.

**Niagara Falls, Ont.**—The Canadian Niagara Power Co. will shortly commence work on improvements to its plant to cost $3,000,000.

**Toronto, Ont.**—The St. Clair Foundry Co. has received a permit and will construct an addition to its factory to cost $2,000. Work will be started at once.

**Brantford, Ont.**—The Ker & Goodwin Co. will build an addition to their machine shop to cost $4,000. The extension will be equipped with machinery for making shells.

**Kingston, Ont.**—It is reported that a new factory will be in operation shortly for making shells. The plant of the North American Smelting Co. will probably be leased.

**Medicine Hat, Alta.**—The International Supply Co., is equipping a plant for making shells. The Alberta Foundry and Machine Co., and the Alberta Pump and Brass Works have also received contracts for shells.

**Edmonton, Alta.** — A contract has been received by the Western Foundry and Machine Co., for the manufacture of 10,000 shells, a similar order having been placed with the Edmonton Iron Works. This will mean an outlay of something in the neighborhood of $100,000.

**Toronto, Ont.**—The Chapman Double Ball Bearing Co. have applied for a permit at the City Architect's Department to build an addition to their factory with a view to starting the manufacture of high explosives for the British Government. The building will cost $5,500 and will be an extension to the present plant.

**Fort William, Ont.**—A Government commission will visit this district to examine the iron resources and possibility of development. J. Dix Fraser, manager of the Atikokan Iron Works, is interested.

## Municipal

**Thorold, Ont.**—The Beaver Board Co. factory was damaged by fire recently. The loss is estimated at $17,000.

**St. Raymond, Que.**—The purchase of fire-fighting apparatus is contemplated by the Council.

**London, Ont.**—The City Council will purchase a combination chemical and hose wagon.

**St. George, Ont.**—A by-law has been carried providing for the installation of Hydro-Electric power. Estimated cost, $6,000.

**Milverton, Ont.**—The installation of a Hydro-Electric lighting system is contemplated.

**Bedford, Que.**—Extensions and improvements will be made to the water distribution system.

**Owen Sound, Ont.**—The Town Council contemplate the purchase of a motor truck, estimated to cost about $5,000.

**Tavistock, Ont.**—A by-law to accept $7,500 for the Carnegie Free Library was carried here on May 27 by 103 majority.

**Lynden, Ont.**—A by-law will be voted on by the ratepayers to raise $4,500 for the construction of a Hydro-Electric power plant.

**Kingston, Ont.**—A by-law will be voted on by the ratepayers on June 21 to raise $7,000 to purchase a site for the proposed incinerator.

**Thamesville, Ont.**—A by-law has been passed providing for the installation of a Hydro-Electric lighting system at an approximate cost of $6,250.

**Lindsay, Ont.**—The Horn Bros. by-law will be submitted to the ratepayers at an early date. The company are asking the town to guarantee bonds to the extent of $65,000.

**Unionville, Ont.**—A fire protection system is contemplated for this village. E. A. James, consulting engineer, Toronto, estimates the cost of a complete system (fire and domestic) at $5,000.

**Stratford, Ont.**—The council has finally passed at the request of the Water Commission a by-law to borrow $50,000 for the purpose of installing a gasoline pumping plant and water tower.

**Kingston, Ont.**—It is announced that the agreement covering the Campbell power contract has been received from the Hydro Commission, and has been forwarded to the city solicitor for approval and adoption by the city council.

**Stratford, Ont.**—The ratepayers voted against a proposal to grant the Canadian Bartlett Automobile Co., Toronto, $2,500 and a fixed assessment at $7,500 for ten years in return for establishing a factory here. Lack of public interest rather than organized opposition was responsible for the failure to pass the by law.

### EQUIPMENT FOR AUSTRALIAN RAILWAYS.

**Tender forms, specifications and indents have been forwarded by D. H. Ross, Trade Commissioner at Melbourne, for equipment required by the Victorian Railways, New South Wales Railways and Western Australian Tender Board. These tender forms have not yet come to hand, but when received, they may be inspected by interested Canadian manufacturers at the Department of Trade and Commerce, Ottawa (refer File No. 1435). Particulars of the requirements, together with the date on which the tenders close at Melbourne, are briefly outlined thus:—**

**Victorian State Railways, Melbourne.**

**No. 28,766, July 7, 1915. — 1 semi-automatic screw slotting machine and accessories.**

**N. 28,780, July 14, 1915. — 2 armature banding machines and connecting gear.**

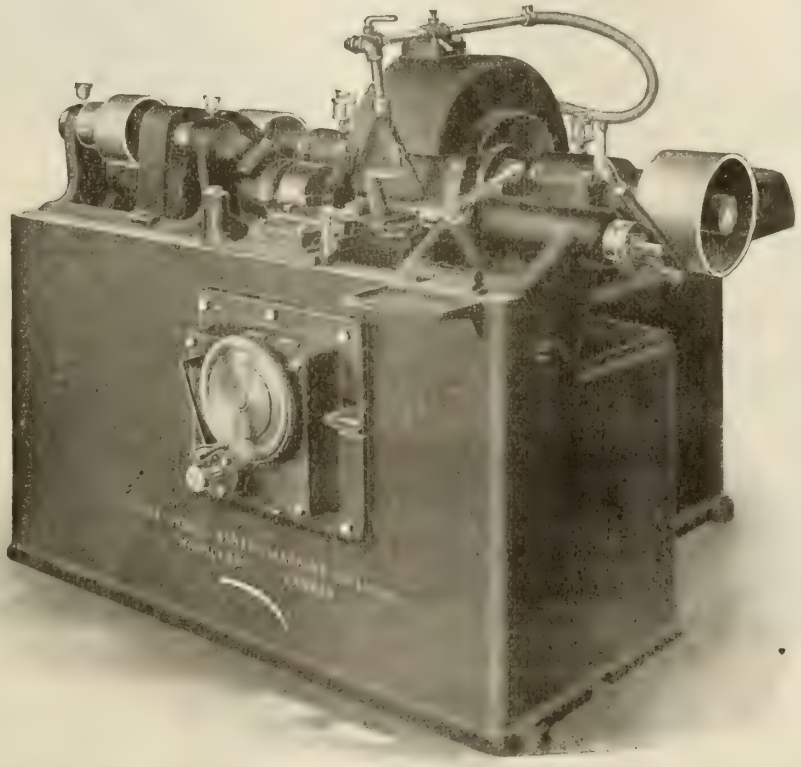
**No. 28,795, July 14, 1915. — 3 voltmeters as specified.**

**No. 28, 795, July 14, 1915. — 4 amperemeters as specified.**

**No. 28,795, July 14, 1915. — 5 wattmeters as specified.**

**The departure of mails from San Francisco and Vancouver are indicated thus:—From San Francisco —June 8, due Melbourne June 29; from Vancouver—June 9, due Melbourne July 3.**

# The Ford-Smith One Operation Shrapnel Shell Grinder



A Powerful Extra Heavy Grinder for finishing Shrapnel and General "Wide Wheel" Grinding.

This machine, using an Abrasive Wheel 20" dia. x 8¼" face, grinds both body of shell and nose as quickly as the lighter type general purpose precision grinders can grind the body alone.

Depending on the amount of stock left for finishing, we grind from fifteen to sixty-five shells without re-trueing the wheel.

**POWER**—Two 6" Belts drive the Emery Wheel Spindle, one 4" Belt with one to four gearing drives the shell.

**RIGIDITY**—Machine weighs 7,000 pounds of carefully distributed metal, with an absolute absence of vibration.

**CONTROL**—Necessary levers, etc., all in front, the wheel trueing device swings into position when required.

**ABRASIVE WHEEL** is held solidly between two 3¾" bearings, on Safety Flanges, and six to 10,000 shells can be ground before renewing.

We have twenty-five of these machines in operation, doing from one hundred and forty to two hundred shells per ten hours, according to amount of stock left on the shell.

It will pay you to investigate this machine in comparison with your lathe work, or other grinder performances.

2½" Acme Bolt Cutter (Used).

**London, Ont.**—The council have decided to take no action with regard to the installation of a hydraulic plant at Springbank until a further report has been received. It is estimated that it will cost $10,000 to repair the old machinery and $19,000 for a new plant.

**Listowel, Ont.**—A large number of representatives from each of the municipalities interested in the proposed Hydro-Electric line from a point near Mitchell to Clifford, met here recently. A resolution was adopted in favor of the proposed scheme.

**Mimico, Ont.**—At a special meeting of the council, it was practically agreed to accept the terms of New Toronto for the supply of water from the system of that municipality. It is proposed to install a meter in each residence and place of business to register the consumption.

**Dorchester, Ont.**—Hydro-Electric, enabling and money by-laws were carried almost unanimously by Dorchester ratepayers on May 21. On a by-law to ascertain the opinion of the qualified voters on the question of obtaining power from the Ontario Commission the figures were 70 in favor and only 3 against. On a by-law authorizing expenditure of $4,800 on a distributing plant the vote was 69 for and 4 against. The village is already receiving Niagara power from London.

# Trade Gossip

**Shell Committee Headquarters.**—The headquarters of the Dominion Shell Committee have been transferred from Montreal to Ottawa.

**The Canadian Fairbanks-Morse Co.** have been awarded a contract for six railway motor cars by the Greater Winnipeg Water District Commission.

**The Williams Machinery Co. of Winnipeg, Ltd.**, have sold a gasoline engine, transmission machinery and machine tools to the Greater Winnipeg Water District Commission.

**Workmen's Earnings on the Clyde.**—It has been stated that the earnings of the men on the Clyde have increased considerably of late. A wages return from Greenock shows that one riveter has earned as much as $53.50 in a week. His weekly wages for the month ending April 14 were as follows: March 24, $35.25; March 31, $30.50; April 7, $51; April 14, 53.50.

**Steel Workers to Australia.**—We understand that fifty expert iron and steel workers recently arrived in Sydney, New South Wales, from the United States. They have been engaged to take up position in the recently-erected iron and steel works at Newcastle, and will undertake the instruction of a number of Australians in the industry. A further party has also been arranged for.

**Vancouver, B.C.**—An order for 1,500,000 feet of lumber has been placed with the Canadian Western Lumber Co., Fraser Mills, by the Dominion Department of Railways and Canals. The British steamer Durley Chine, which sailed from Halifax at the beginning of last month, will load this shipment for Port Nelson, where the lumber will be used in connection with the construction of the Hudson's Bay Railway terminals.

# Tenders

**Kingston, Ont.**—Tenders will be called for the purchase of a 300-kilowatt a. c. generator. For particulars apply to Dr. W. W. Sands, city clerk.

**Hull, Que.**—Tenders will be received up to June 7 for the supplying of waterwheel, electric generator and centrifugal pumps. Specifications and plans may be obtained at the office of the city engineer, J. P. A. Laforest.

**Montreal, Que.**—Tenders will be received up to Monday, June 7, 1915, for the construction of west extension grain elevator No. 1, Harbor of Montreal. Conditions upon which copies of the plans and specifications may be obtained will be furnished upon application to F. W. Cowie, chief engineer.

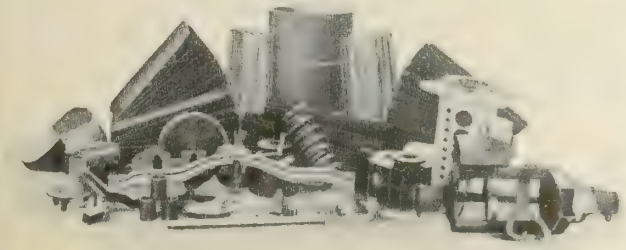
**Toronto, Ont.**—Tenders for all trades for roof, etc., required on new boiler house, main pumping station, foot of John Street, will be received up to Tuesday, June 8, 1915. Specifications and forms of tender may be obtained at the office of the City Architect, City Hall.

**Winnipeg, Man.**—Tenders addressed to the Chairman, Board of Control, will be received up to Saturday, June 5, 1915, for the manufacture, delivery and erection in the generating station at Point du Bois of one 150 k.w. motor-generator exciter set. Instructions to bidders, specifications and form of tender may be obtained at the office of the City Light and Power Department, 54 King Street, Winnipeg.

**Burlington, Ont.**—Tenders will be received until Tuesday, June 15, 1915, for the following works:—Contract "A"—Labor laying sanitary and storm sewers sub-divided into eight contracts; "P"—Constructing sewage pumping station; "S"—Furnishing sewer pipes; "X"—Constructing sewage disposal works. Plans and specifications may be seen at the office of Chipman & Power, engineers, Mail Building, Toronto, or at

# A FEW ARTICLES

*Including Steel, Aluminum, Cast Iron, Malleable Iron, Brass, Copper and Sheet Steel that have been*



**WELDED BY OUR OXY-ACETYLENE PROCESS**

With our welding outfits on the job, you will increase the productiveness of your plant and save many an expensive machine part from the scrap heap.
**The Approximate Cost of Oxy-Acetylene Welding:**
Oxygen at 3 cents per cubic foot—
Acetylene at 1 cent per cubic foot—
**nothing as compared with service rendered.**
LET US PUT FULL DETAILS BEFORE YOU NOW. Send in your request for same now—**you've nothing to lose and much to gain.**

DROP FORGINGS

the office of J. C. Allen, town clerk, Burlington.

**Toronto, Ont.**—The Advisory Industrial Committee of the Board of Education will receive tenders on or before Tuesday, June 8, 1915, for furniture, bicycle racks, metal numbers and letters, picture framing, paper trimmers, blue print ironer, cupola, steam engine, plumbers' and steamfitters' tools, etc., power sewing machines, bricklayers' and plasterers' tools, dust collector system, physical apparatus, projection apparatus, tool grinders, gas and electric furnaces, ladders. Plans and specifications may be seen at the Principal's Office, Dr. A. C. McKay, Technical School, 149 College street.

## Personal

**E. V. Buchanan**, who has been electrical engineer at London, Ont., for some time, has been appointed general manager of the commission to succeed Mr. Glaubitz, who has resigned.

**Lieut. James Gordon Ross**, of the 13th Battalion, whose name recently appeared in the casualty list as wounded, was consulting engineer of the Milton-Hersey Co., Montreal, and was a lieutenant in the 5th Royal Highlanders.

**Pierre Martin**, one of the inventors of the Siemens-Martin process of steel-making, commonly known as the open hearth method, died at Paris on May 23. He was a member of the firm of Martin Bros. of Sireuil, France.

**Alexander Baird**, who, for many years, was superintendent with Cowan & Co., Galt, Ont., has accepted a position with the Canada Machinery Corporation, Ltd., as superintendent of their Hespeler factory, which will resume operations at an early date.

**R. S. Richardson**, for some time assistant superintendent of the Halifax and St. John district of the I. C. R., with headquarters at Moncton, has been appointed superintendent of the Fort William-Winnipeg division of the N. T. R., with headquarters at Winnipeg, Man.

## Catalogues

**High Speed Drills.**—A very attractive catalogue has been issued by Baker Bros., Toledo, Ohio, dealing with the heavy pattern high-speed drills which they make. Each type is described in detail, covering the principal features and accompanied by a specification giving all the leading dimensions and other data. The half-tones are excellent reproductions and show in a clear manner the general design and location of parts.

# CLASSIFIED ADVERTISEMENTS

¶ Those who wish to sell or buy a business, obtain competent help, connect with satisfactory positions, or secure aid in starting new enterprises should not fail to use the Want Ad. Page of "CANADIAN MACHINERY."

¶ If you want to sell or buy a second-hand lathe, planer or any other shop equipment, let "CANADIAN MACHINERY" pick out a seller or buyer for you. How about that second-hand engine or boiler which you would like to dispose of?

Rates (payable in advance) :—2c per word first insertion, 1c per word subsequent insertion, 5c additional each insertion when Box Number is required. Each figure counts as one word.

### FOR SALE

THE PROPRIETOR OF LETTERS PATENT No. 126215, relating to "Pump device" desires to dispose of the patent or to grant License to Interested Parties at reasonable terms with a view to the adequate working of the Patent in Canada.
Inquiries to be addressed to the patentees, Aktiebolaget Ingeniorsfirma Fritz Egnell, Stockholm, Sweden.

McKaig's Combination Pliers
A new invention, an improvement over the old style. When the cutters on other pliers get dull they won't cut.
"SURE CUTTERS" will cut perfectly, no matter how dull the edges get.
When the hold gets loose on other pliers, they won't cut — but "SURE CUTTERS" do the work just the same.
Try them—order now, before you forget it.

McKaig Drop Forge Company
Buffalo, N.Y.

WANTED
Foundry and Machine Shop
To locate in the flourishing Town of Hawkesbury, where amongst four fairly large manufactories, in the last three years one firm alone used 400 tons.
WHERE—Abundant electric power is available at reasonable rates ($25 H.P. per annum).
WHERE—Shipping is easy by the G.T.R. and Canadian Northern main line and Ottawa River.
WHERE—Much old casting and scrap iron is available.
WHERE—An important famous trade in foundry work could be waked up.
Also good opening for other industries.
For particulars apply to
BRUNO BOUVRETTE,
Secretary,
Hawkesbury Board of Trade.

**Smooth-On Iron Cement No. 7** is the subject of pamphlet No. 4 being distributed by the Smooth-on Mfg. Co., Jersey City, N.J. This material is used in combination with Portland cement for waterproofing brick and concrete construction. Views are included showing swimming pools waterproofed with this mixture. Copies of this pamphlet will be mailed on request.

**The Jones Underfeed Stoker** is described in a new bulletin issued by the Jones Underfeed Stoker Co., Ltd., Toronto. The bulletin contains a detailed description of the stoker with special reference to the principal features embodied in the construction and its application to various types of furnace. The smokeless feature of this stoker is dealt with, and the illustrations show a number of installations and sectional views of furnaces.

**Electric Drills.**—Bulletin No. 103 fully describes twenty different styles and sizes of the "Hisey" improved portable electric hand and breast drills for operating on either direct or alternating current. The universal motor type drills also described are designed for operating on either direct or alternating current of the same voltage. The catalogue is fully illustrated and tables give the essential particulars for each type. Copies may be obtained from the Hisey-Wolf Machine Co., Cincinnati, Ohio.

**Wagon and Truck Loaders.**—The many uses to which the Jeffrey wagon and truck loaders are adapted are described in bulletins No. 5, 165 and 166 recently issued by the Jeffrey Manufacturing Co., Columbus, Ohio. These bulletins describe in detail the standard types of loaders for handling coal, coke, crushed stone, sand, and other loose materials. The various types are illustrated and specifications are included for each with prices and weights, etc. Copies will be mailed to interested readers upon request.

**The June issue of Graphite**, the house organ of the Joseph Dixon Crucible Co., contains upon its cover a splendid reproduction of "The Pour," a bronze statue at the offices of the Damascas Bronze Co., Pittsburgh, Pa. "The Pour" was modeled by H. Mueller and and imported from France. Though efforts have been made to trace its origin, no further knowledge of it has been obtained. Graphite contains its usual miscellany of good things to read.

1—22" x 16' David Pond.
1—22" x 12' Pond.
1—26" x 14' Grant & Bogart, taper att.
1—Roll Lathe, 39" swing, 9' centers.
1—36" x 20' Pittsburgh.
1—42" x 24' American Engine Lathe.
1—50" x 18' Fifield.
1—60" x 43' Roche Engine Lathe.
1—60" x 46' Hewes & Phillips, comp. rest.
1—60" x 43' Hewes & Phillips, comp. rest.
1—10' x 43' Bement-Miles Crankshaft Turning Lathe.

**SCREW MACHINES AND TURRET LATHES.**

2—2" Cleveland Automatic Turret Lathes.
2—2½" Pratt & Whitney Geared Head Turret Lathes.
1—1½ Pratt & Whitney Turret Lathe.
1—2" Pratt & Whitney Turret Lathe.
1—No. 2 Warner & Swasey Turret New Model Screw Machine.
1—22" Libbey Turret Lathe.
1—⅞" x 4" Brown & Sharpe, auto. chuck.
1—No. 2 Foster, Pl. head.
1—No. 3 Bardons & Oliver.
1—1½" Dreses, wire feed, power feed to turret.
2—2" x 24" Jones & Lamson sliding head—chucking.
1—24" Davis Chucking Lathe.
1—24" x 10' Lodge & Shipley with power cross feed.

**The above are in our Cleveland warehouse, will be shipped on approval, and are all good, carefully selected tools.**

# Go to Chicago With Your Ad Man

**Attend with him the big Convention of Associated Advertising Clubs of the World, June 20 to 24, 1915.**

You will assimilate more knowledge of modern methods of Advertising, Selling, Distribution, and Management during these five days than could be obtained in a life-time of book study.

You will be brought in touch with the men who have done and are now doing the big things of business. You will participate in the biggest business meeting the world has ever known. You will listen to the expressed thoughts of distinguished Americans concerning present day and future business movements.

You will enjoy Chicago's wonderful park system, boat rides on Lake Michigan, modern hotels, theatres, and other amusements, including the big street pageant, and the Gridiron Show given at the Auditorium Theatre by 150 Chicago Advertising men.

*Distinguished Speakers.* President Wilson, State conditions permitting, will head the notable array of speakers. Hon. William Jennings Bryan, George Horace Lorimer, Arthur Brisbane, John H. Fahey and Henry Watterson are among the others who will be heard.

**Advertisers in and publishers of trade and technical journals will hold special Departmental meetings to discuss their own problems and learn how they can co-operate to better advantage. Other departmental meetings will take up such subjects as catalogues, engraving, printing, mailing lists, sales plans and kindred subjects.**

*The ladies* are wanted too. Special entertainment—teas, luncheons, automobile trips, etc.—is being arranged for them by Mrs. Chas. H. Porter and her committee.

Clear up your desk. Take a five days' vacation in a lake-cooled city. Mix with the business builders. You will return a better business man; a better physical man; and a better thinking man.

**For further information, programme, rates, etc., address Convention Bureau, Advertising Building, Chicago, Ill.**

# Keep Up The Connection

you have made by past efforts in advertising. New friends are alright, but it is a fallacy for one thing, and bad business for another, to create a demand for goods or service and then lose the fruits of your work by default. Letting your old friends know that you want their business is also the surest way to gain new ones.

Advertising in CANADIAN MACHINERY is the medium.

Rate Cards and full particulars on request.

# *Avoid* the "Penny-Wise Pound-Foolish" Way of Using *Files*

At a certain point in its life on *any* work, a File's *best efficiency* is lost.

Beyond that point it's a "time-killer." The extra time it wastes would pay for *several* new files.

Many mechanics "economize" by using files past the "efficiency" point. They *save pennies* in *file-cost*—and *waste dollars* in *valuable time.*

Don't let this "penny-wise pound-foolish" method eat up profits on YOUR work.

See that your men discard *worn* files PROMPTLY—and replace them with the "Famous Five":

## KEARNEY & FOOT
## GREAT WESTERN
## AMERICAN
## ARCADE
## GLOBE

***(Made in Canada)***

They represent the *efficiency* of 50 years' *experience.* The *economy* of a *60,000,000* output yearly. The *accuracy* of *5* great plants full of special machinery. The *uniformity* of complete control—from furnace to file. The *success* achieved in supplying 90% of Canada's file-requirements.

**The MORE you know of the "Famous Five"—the more net profits you can make. "File Filosophy" and our Catalog sent FREE.**

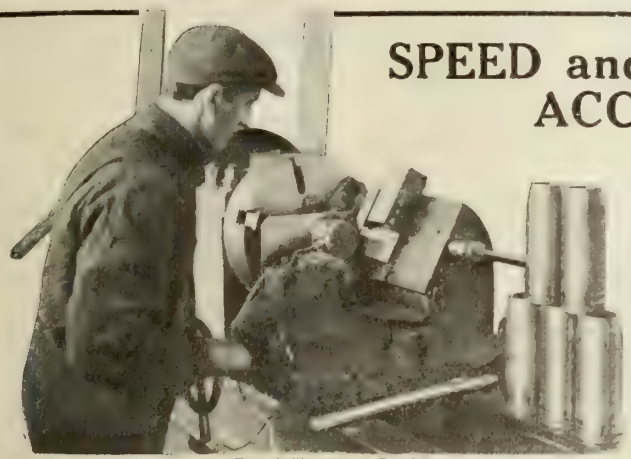
HAGERSTOWN, MD.
SAND-BLAST SPECIALISTS

P. O BOX 865



Band Turning Lathe

## SPEED and ACCURACY

The two most important factors in the machining of shrapnel and 4.5 shells, speed and accuracy, can be achieved when turning copper bands by using this machine.

The cut at the left shows an operater turning copper bands on our machine. His **daily output** averages well **over thirty shells per hour**.

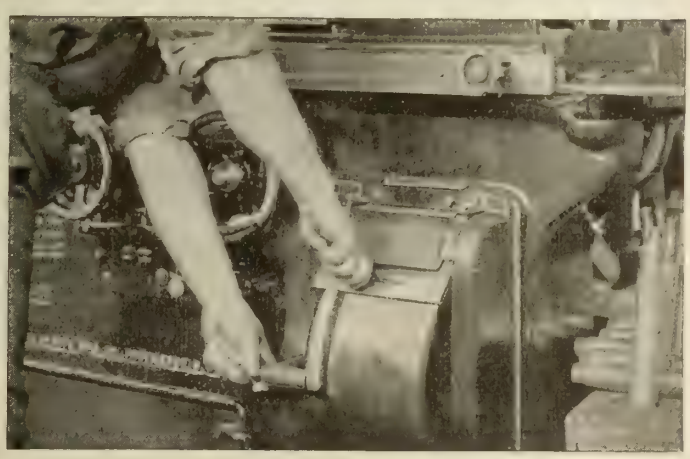
This lathe was designed and built by us especially for this work. It is of sufficiently heavy construction to enable it to stand up under the strenuous work demanded of shell making machinery.

**Some of the largest manufacturers have found it profitable to adopt it. Let us tell you why. We invite your inquiry.**

## The Jenckes Machine Co., Limited

**Sherbrooke, Quebec**

Branches at Toronto, Ontario, 728 Traders Bank Bldg
Montreal, Que., 303 E. T. Bank Building
St. Catharines, Ont.; Cobalt, Ont.; Vancouver, B.C.; Nelson, B.C



## Brown & Sharpe Plain Grinding Machines for Fast Production.

Here is our No. 16 Plain Grinding Machine with a capacity of 10" in diameter and 72" in length, one of our line of five manufacturing grinding machines of various sizes. In addition to the time-saving feature of quick-feed and speed changes, look at some of the other good points. There is the automatic cross-feed which automatically sizes the work, and is set to quarter-thousandths without reference to graduations; combination back rests which support with correct pressure either heavy, medium or light-splined work; massive parts and convenient arrangement of levers. Send for a full description showing why they are economical.

## Save Grinding Time, Get the Right Speed and Feed Quickly

No trouble getting the right combination of work speed and table travel, no temptation to let a wasteful combination stand on B. & S. Plain Grinding Machines. It's a quick and easy operation to shift from one job to another. See in the cut how simple it is to change the rate of table travel, while the work speed case at the right is operated in the same manner. Both are self-contained and independent. A driving belt to the work prevents gear marks.

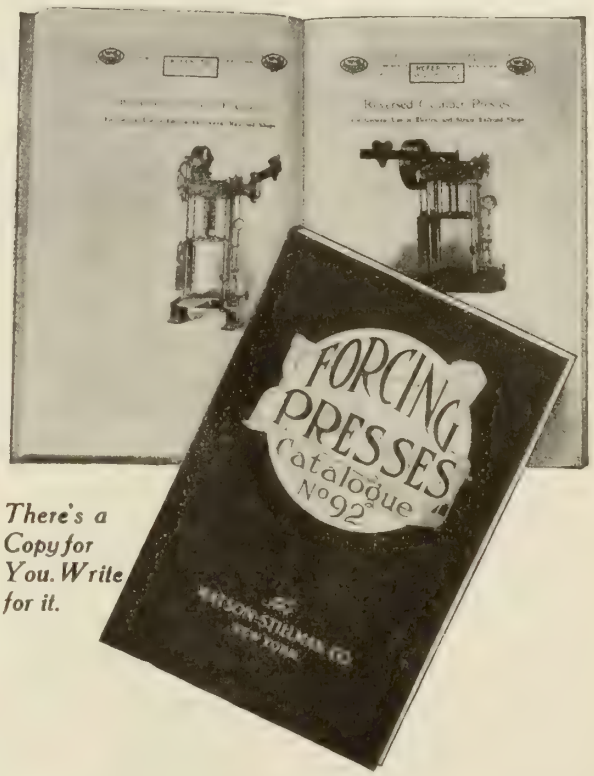
**NEW BEDFORD MASS., U.S.A.**

# THERE'S A DIFFERENCE IN HYDRAULIC PRESSES



*There's a Copy for You. Write for it.*

Get this new catalog, examine it and see the basis of our claims for Watson-Stillman superiority.

There are 128 pages showing cuts, tables and other data of the various types of forcing presses of Watson-Stillman design. Presses for wheel forcing, crank pin forcing, bolt forcing, mandrel pressing, broaching, drawing, forming, die pressing, forging, ingot piercing, briquetting, baling, spring banding, projectile capping and banding, and presses for special and miscellaneous purposes, together with other information for complete hydraulic press installations.

Write for catalog at once, and with your request tell us about any installation you have in mind in which hydraulic machinery might be a possibility. Our Engineering Department will tell you the best course to be followed. Our line is complete, including fittings, valves, pumps, accumulators, benders, shears, jacks, lifts, etc.

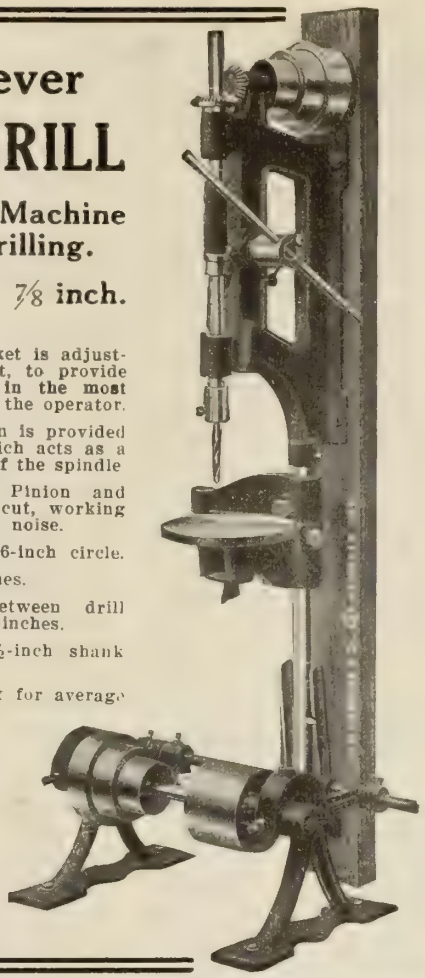
## 16 in. Lever
# POST DRILL

**A Giant Little Machine For Light Drilling.**

**Will drill up to 7/8 inch.**



The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

Drills to centre of 16-inch circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 23 inches.

Spindle bored for ½-inch shank twist drills.

Speed of countershaft for average work, 300 per minute.

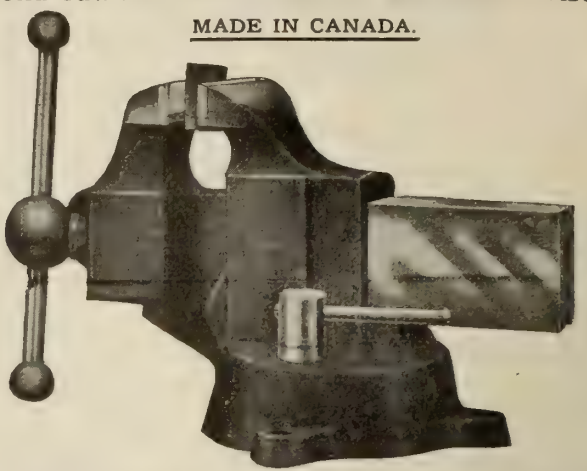
**A. B. Jardine & Co.**

Hespeler, Ontario

# The YOST

**Solid Jaw and Swivel Bottom Machinist's Vise**

MADE IN CANADA.



A vise with a grip like grim death; a durability that defies time and the hardest usage.

A vise that will give you a lifetime of perfect service and satisfaction. The metal in a Yost Vise is of faultless quality, perfectly distributed and the workmanship is

***Incomparably Good***

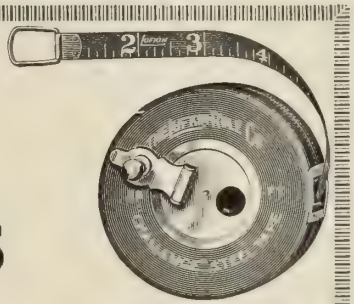
The National catalog would certainly interest you. Write us, asking for a copy.

**National Machinery & Supply Co., Ltd.**

HAMILTON - - ONTARIO

**This Guarantee Goes With Every Vise:** We fully guarantee all of our Vises to be satisfactory in every particular and will promptly replace, without cost, any parts broken or badly worn when such failures are due to faulty material or construction.

# LUFKIN



# TAPES AND RULES

## NOTED FOR ACCURACY

We make a complete line of

MACHINISTS' SCALES — MEASURING TAPES
FOLDING STEEL RULES — WOOD RULES
FOLDING BOXWOOD RULES
SPRING JOINT RULES

Our goods are stocked by prominent hardware and supply houses throughout the Dominion. They are fully guaranteed.

**Catalogue on request.**

## MADE ESPECIALLY FOR MILLING BRIDGE REAMERS

You will notice that this machine has a double or elevating table, the top section being pivoted at the rear end, and raising and falling between substantial guides cast with the lower half or side on the front.

Provision is made to bolt suitable cams or forms to side of table, which engage with roller carried by a bracket bolted to face of saddle as seen in illustration. These cams are so formed and applied as to allow for continuous fluting of reamers having both initial and secondary tapers or with taper start and straight body.

THE EIGHT SPINDLE CENTERS SHOWN MOUNTED ON TABLE OF MACHINE INDEX IN UNISON, AND THE COMBINED EQUIPMENT MAKES A VERY EFFICIENT MACHINE FOR THE CLASS OF WORK INTENDED.

**Let us tell you more. Mail us your request for catalog and full information.**

# The Tap with the Con-eccentric Land

## For Tapping Nuts

**One-third of the land from the cutting edge is concentric. The remaining two-thirds has eccentric relief.**

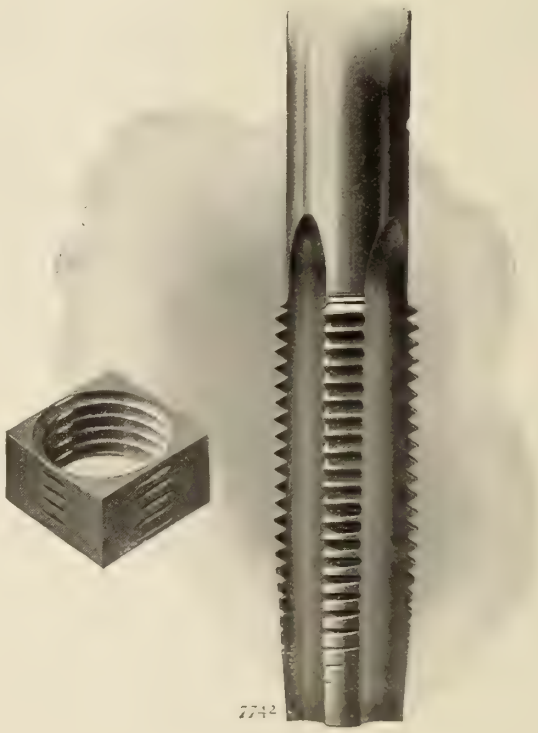
TO show more clearly the free-cutting qualities of these taps, a nut slightly smaller than one and one-quarter inches square was drilled for tapping and held lightly by the corners. The nut was then tapped with a 1¼-7 U.S.S. con-eccentric tap, driven through without reversing. (See cut on right).

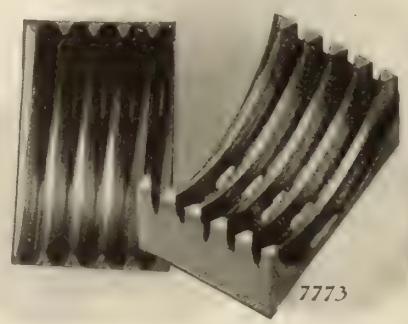
So perfect were the cutting qualities and so easily and freely was the work done that this mere shell of a nut was *not even distorted,* to say nothing of being split as would have happened with a tap differently constructed.

Consider what this means to the nut manufacturer from the standpoint of a *saving in power.* This is but one reason why Pratt & Whitney taps are specified by the largest nut manufacturers in the country.

For a number of years we have made taps with this style of relief. They have won out steadily and consistently on merit alone.

**Write for our Booklet "The Tap with the Con-eccentric Land."**





TAPS can be sharpened at the only correct point — on the face of the cutting edge.

Sharpening in no way affects their size.

Can be sharpened long after other so-called eccentrically-relieved taps are rendered useless.

We obtain the freest cutting tap with the longest life—an exclusive combination.

Accuracy nowhere else obtainable is secured together with a degree of finish and refinement heretofore thought impossible in a commercial tool.

We want tap users to know *why Pratt & Whitney taps are best,* also that our claims are based on reasons mechanically correct.

Cut to left is a tapped nut sawed in half showing small area of metal which held it together.

The taps are carried in stock by our Branch Offices and Agencies throughout the world. Prompt service assured to all customers wherever located.

By B.G.N.

## Increase Your Efficiency

THIS is an age of efficiency. Hundreds of thousands of dollars are saved annually that were formerly scrapped in the form of needless labor and unnecessary operations.

By applying efficiency methods to the publishing of technical papers we have been able to save hundreds of dollars annually in our own business.

You will secure many very valuable ideas from a careful, systematic study of Canadian Machinery.

The educative value of the advertising pages of technical journals is now so generally recognized that it is unnecessary for us to remind you of this very important feature of *your* paper. You will find listed here the newest and most reliable in equipment and supplies.

A careful study of Canadian Machinery advertising pages will prove a liberal education in itself.

# $5,000,000.00 per Day

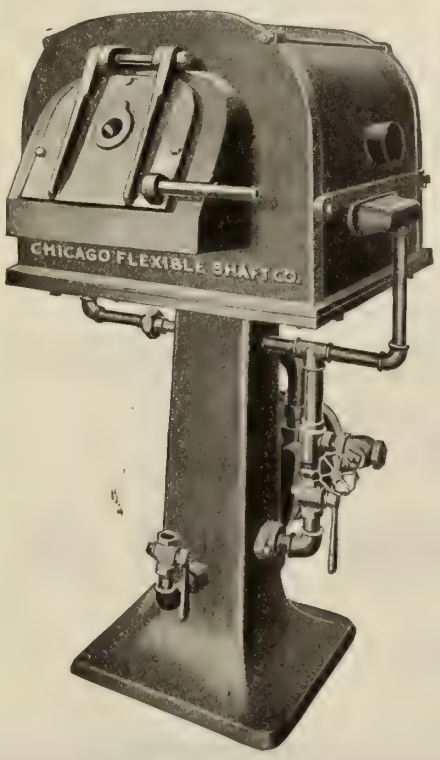
and more is the estimated amount being spent on ammunition alone by the warring powers. Much of it is for projectiles, for this is the War of a vast number of shells, especially shrapnel.

Those firms whose plants are equipped with

# STEWART GAS and OIL FURNACES

find themselves—as usual—in a better position to handle the fast, accurate machining required by these foreign orders.

They heat their forgings quickly, their case-hardening and annealing jobs are done economically and their tools are hardened and tempered with an accuracy impossible to obtain in a coal or coke fire.



"The life of a tool depends on its temper" and the Stewart No. 1 oven shown here has proved useful in prolonging the life of all sorts of cutters and dies. It develops the required heat quickly and holds it indefinitely at any degree of intensity—a characteristic of Stewart furnaces.

**Whatever your requirements we make, or will make, a furnace to handle them economically. Write to-day for our instructive Furnace Booklet.**

## Chicago Flexible Shaft Co.

**210 to 230 Ontario St. Chicago, Illinois**

*The advertiser would like to know where you saw his advertisement—tell him.*

# Higher Tool Efficiency

—the ambition of every up-to-the-minute foreman—has been achieved in more than 1,000 shops in Canada and the United States through the installation of the

## STEWART Special Combination FURNACE

It will handle all the heating operations possible to an oven, crucible, and forge-furnace in the most convenient and economical manner. The Special Combination offers a considerable saving in time, space and money, and will increase the efficiency of your tool room to a notable extent.

Stewart Furnaces have proven themselves without equal in the heat-treating of metals. They will maintain a certain temperature for an indefinite period and will harden or anneal your work exactly as you want it.

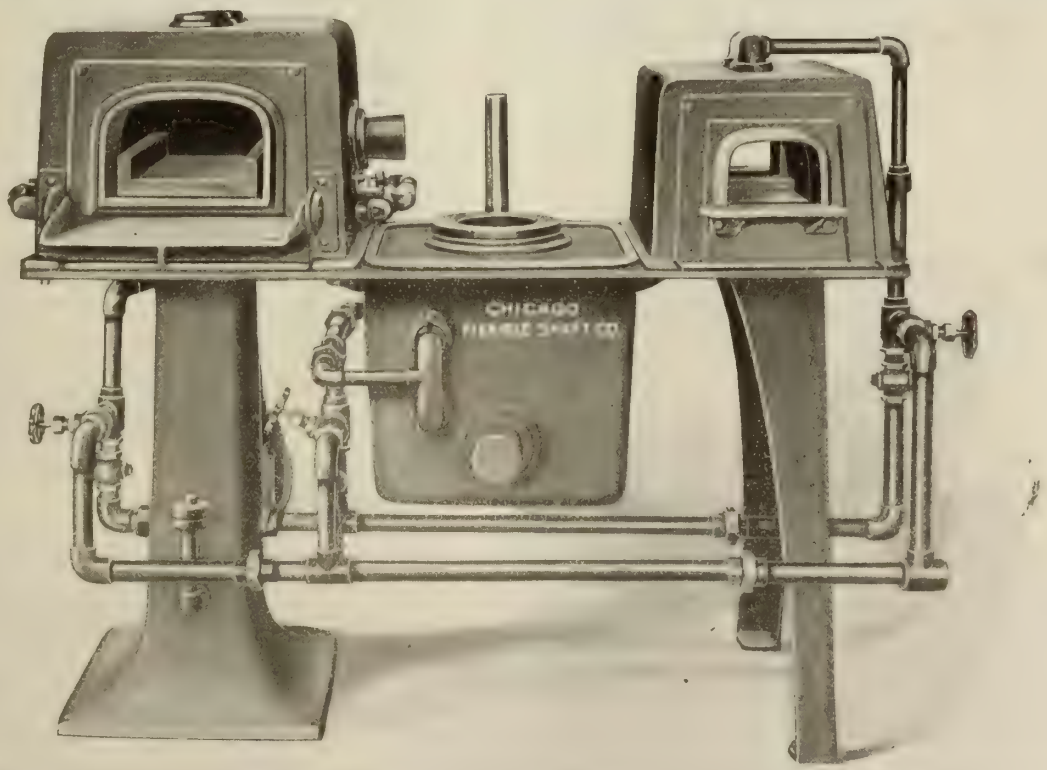
Whatever your requirements in the heat-treatment of metals—case-hardening or hardening of tools and dies, annealing, cyanide hardening, metal melting, brazing, or forging, there is a Stewart Furnace especially designed to handle the work in the most effective and economical way.

We have some interesting information for you — especially if you are manufacturing war materials Put your heat-treatment problems up to Stewart Engineers. They will advise you free.

**YOUR CORRESPONDENCE IS INVITED.**

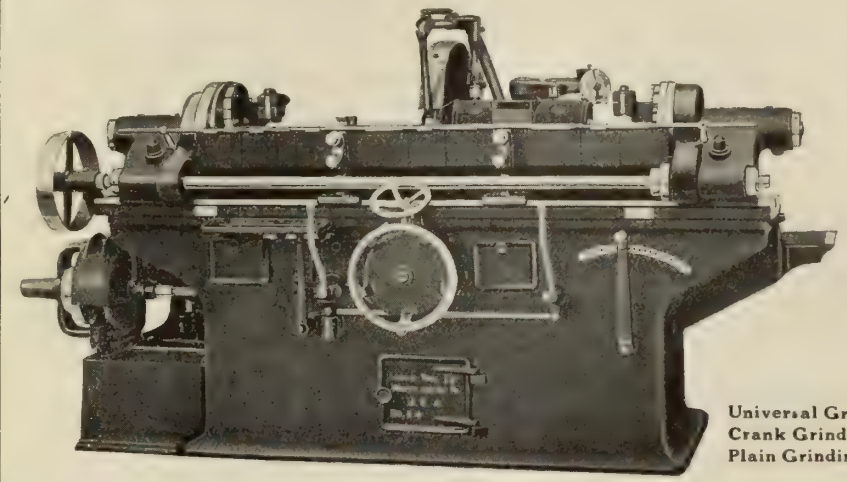
## Chicago Flexible Shaft Company

**210 to 230 Ontario Street** **Chicago, Illinois**



# Crank Production Assured on the Landis

Work held by quickly operated clamping holders—eliminating troublesome and offset centers.
Cranks driven from both ends—preventing twisting of shaft. Setting of the throws is quickly done by use of an eccentric adjustment on the work heads.
The grinding wheel feed is automatic in either direction and controlled by dogs which are quickly and positively set.
A single lever gives the full range of traverse speeds—
The steady rests have two independent adjustments.



An attachment is provided for slow hand motion of the wheel traverse.

The spacing attachment on the rear is operated by a handle from the front of the machine and permits quick location of the various positions (furnished only when ordered).

# A MODERN SAVER

## of Time, Money, Space and Labor

Here is a machine that is well worthy of your attention—our **"Double C Punch and Shear"** with 48-inch **throat.**

This machine has an enormous capacity for doing **rapid, accurate** and **economical** work of **quality**.

Let us send full description. If you are interested in up-to-date money-saving machinery you cannot afford to remain uninformed.

We manufacture a complete line of

**LABOR-SAVING MACHINERY**

all kinds and sizes, for

**Structural Iron Works, Railroad and Locomotive Shops, Boiler Shops, Rolling Mills, Agricultural Implement and Plow Shops, etc.**

**The Long & Allstatter Co.**
**HAMILTON, OHIO**

IT'S A BAKER

# Drilling Shells

**It's just the tool for the job, too.**

It has the rigidity, accuracy, power and reliability that are highly essential to shell making—it has the speed and convenience that means a maximum production at low labor cost.

Every recent improvement is embodied in its design.

Eight speed and twelve feed changes within easy control of the operator.

Machine shown will drive 5-inch high-speed drills to their limit of efficiency in steel. We also build 2½", 3" and 4" capacity machines.

Put your **drilling, boring, reaming, counter-boring, facing, undercutting, box-milling and tapping problems up to a** "Baker"—it's a machine for big results.

**Drop a line for full specifications.**

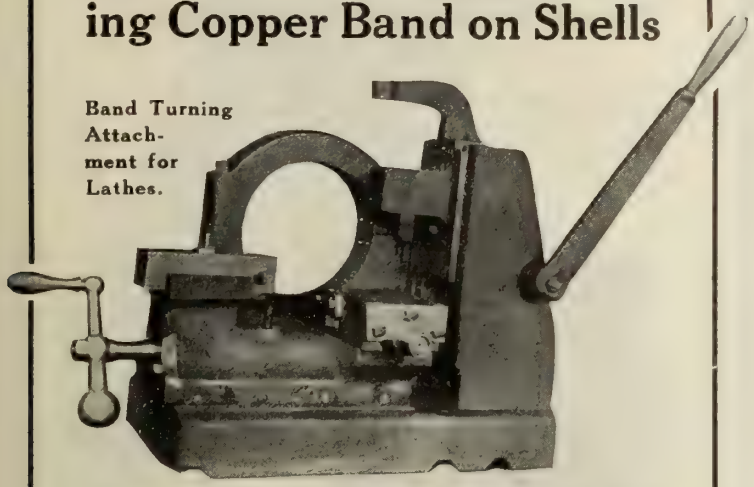
## A Time-Saver for Turning Copper Band on Shells

Band Turning Attachment for Lathes.



This attachment will fit any engine lathe, and with its use you can turn the copper band on Shrapnel Shells down to size required and burnish them *all in one operation.*

With this device we will guarantee an output of

**50 Turned Copper Bands per Hour**

Used with a specially constructed steel chuck, casting of which can be finished on the lathe on which the attachment will be used.

Castipgs are supplied by us.

*WRITE FOR PARTICULARS.*

**LYMBURNER LIMITED**

**5-15 Commissioners St. Montreal, P. Que.**

## Here's a Grinder that Never Needs Be Idle

Because of its greater range of work—External and Internal, Cylindrical, Surface, Disc, Cutter and Reamer Work of all description can be ground with as much accuracy and rapidity on the Bath Universal Grinding Machine as on a single purpose machine.

Changes from one operation to another can be made quickly.

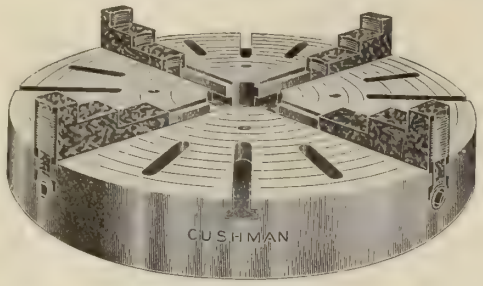
# Cushman Chucks



When you buy a "Cushman" Chuck you are absolutely sure of getting one having strength, accuracy and durability. Being specialists in these goods we are able to furnish Chucks of quality at a very moderate price.

Our line of styles and sizes is very complete—

**Lathe Chucks, Drill Chucks, Centering Chucks, Portable Face Plate Jaws**

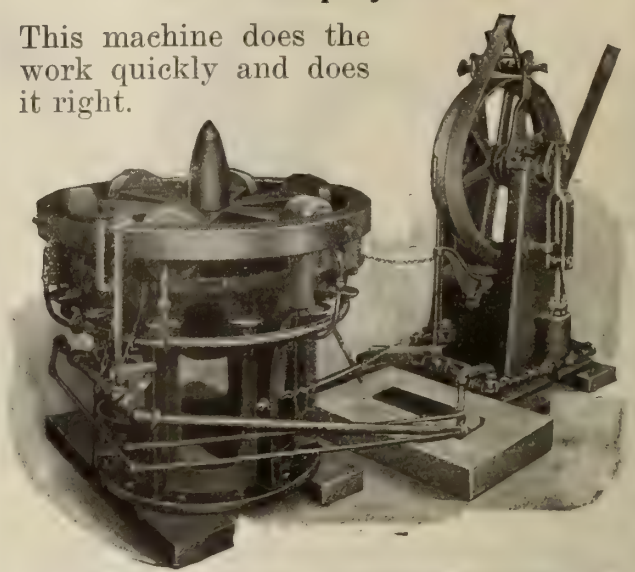
Our regular chucks are known as the heavy pattern, but we now have a new line called "Blue Line" Chucks, made entirely of steel.

**Let us send you our catalog.**

## The Cushman Chuck Co.
**Hartford, Conn., U.S.A.**

# Hydraulic Banding Machine
**For compressing bands on shrapnel shells and other projectiles**

This machine does the work quickly and does it right.



In writing for information or quotation please advise width and thickness of bands and diameter of shells to be handled.
Machines for our Canadian Customers are built in Hamilton, Ont.
We also manufacture machines for setting wagon and carriage tires, cold.

**Please address all communications to our Rochester Office.**

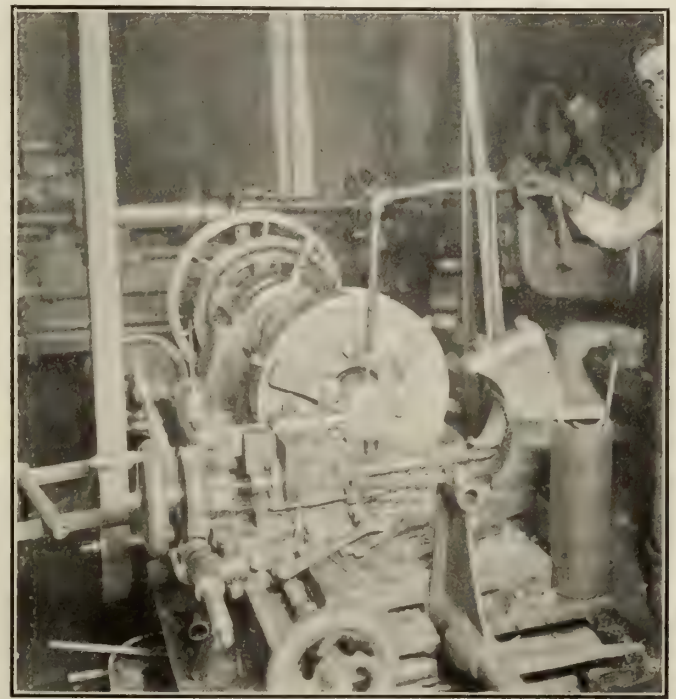
# Shrapnel Shell Manufacture

## Shell Department of a Power Specialty Manufacturing Plant

Staff Article

*Resourcefulness in gripping and mastering the details of shrapnel shell manufacture has not, as will have been noticed from our leading articles in this and recent issues, been confined to any particular section of Canadian mechanical engineering enterprise. The plant here featured, although not a leader in point of size, earns that distinction in its output.*

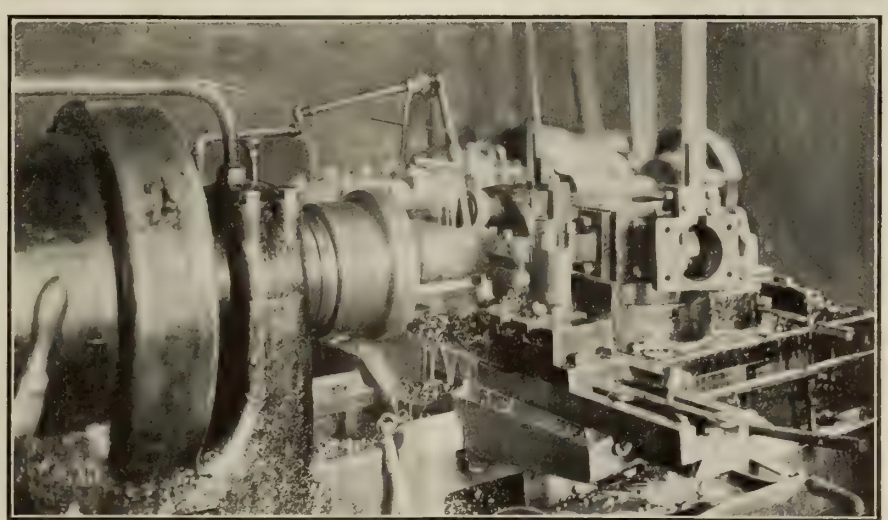
THE plant described in this article was well equipped for conversion to shell making, yet considerable ingenuity had to be exercised in adapting the existing machines, by fitting the necessary tooling fixtures, to suit the new class of work. Although practically no new tools were purchased except duplicates of existing machines in one or two cases, the results have been eminently satisfactory, and further emphasize the progressive spirit of Canadian manufacturers in the engineering field. At this plant shrapnel shells only are at present being made, but the manufacture of high explosive shells is contemplated. The operations hereafter described begin at the machining of the forgings which are received in carload lots.



TRIMMING OPEN END AND SQUARING BASE OF SHELL ON A HURLBUT-ROGERS CUTTING-OFF MACHINE.

### Cutting Off to Length.

The first operation consists of cutting off the forgings at the open end in a Hurlbut-Rogers cutting-off machine. The correct length is regulated by means of a bar gauge carried in a bracket fixed to the end of the machine. The forging is held in a universal chuck, and the bar inserted to a distance regulated by a collar, the bracket acting as a stop, the forging being pulled forward until end of bar touches inside of base. The chuck is then tightened up, the bar removed, and a tool at the side cuts the necessary amount of metal off the end of forging.



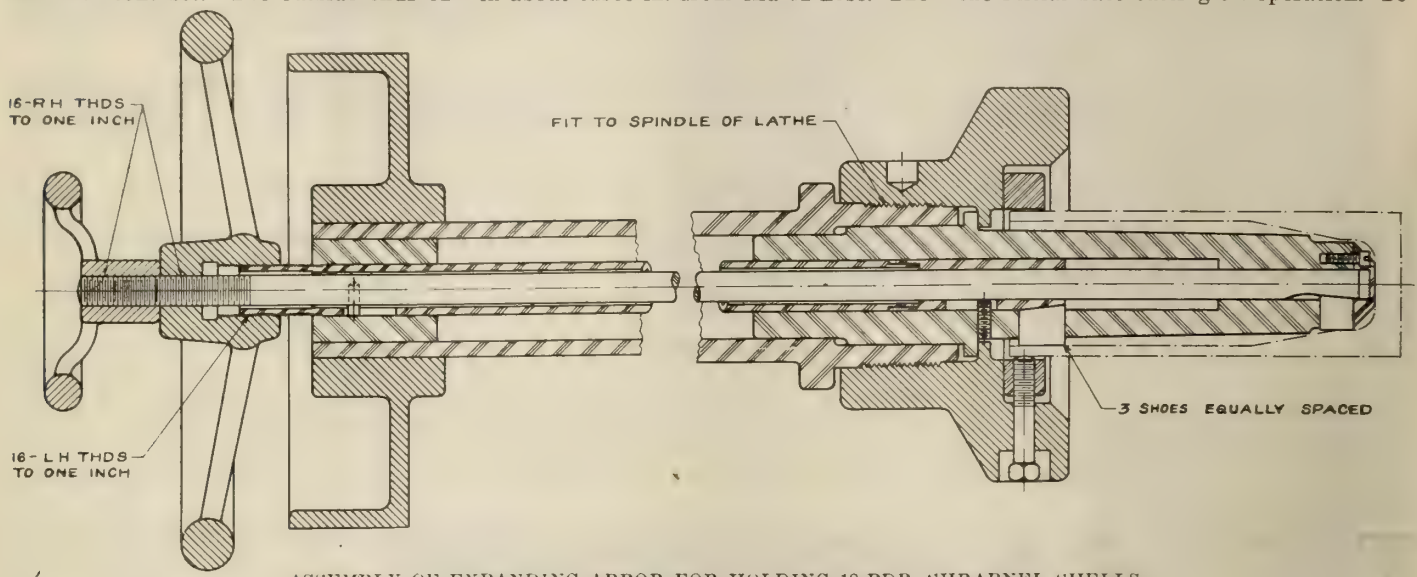
ROUGH TURNING BODY, FINISHING BASE AND FIRST GROOVE CUTTING.

The same type of machine is used for truing up the base of shell forging. The latter is placed in the chuck open end first, until the bottom of the inside of shell touches the stop inside the hollow head-stock spindle. This stop acts as a gauge and insures the forging being cut to the desired length.

### Rough Turning Outside Body.

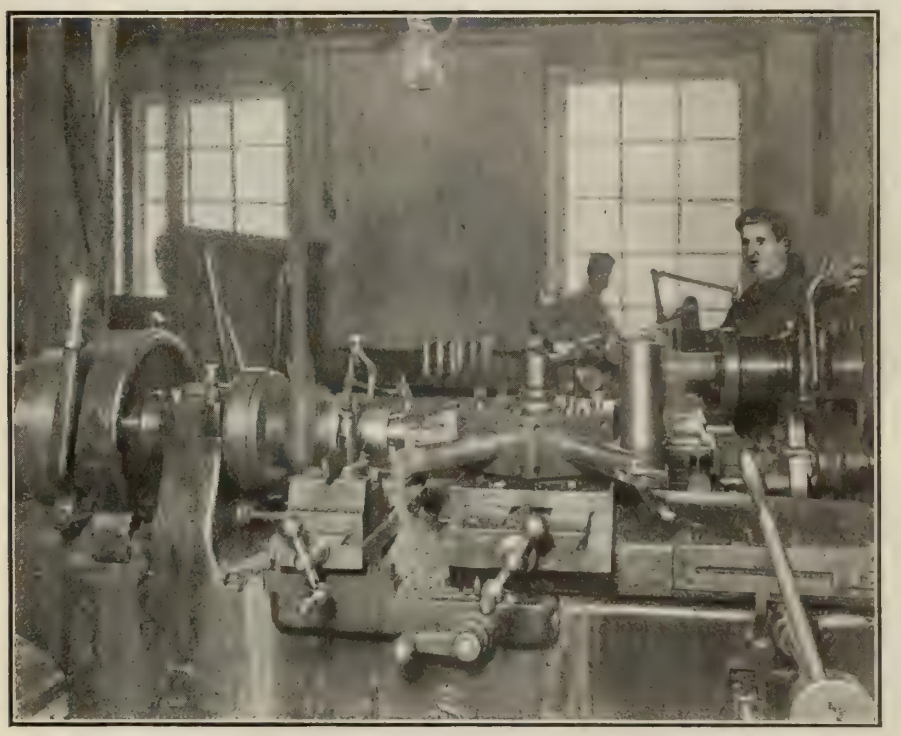
The next step consists of rough turning outside of body, rough turning groove, and finishing base. This operation is performed on a Potter & Johnston automatic, and the style of tooling fixtures can be seen in the illustration. The forging is held firmly in position by means of an expanding arbor, which was designed by the Chapman Double Ball Bearing Co. specially for this class of work. The arbor has three shoes at the front and three at the back, all tapered, which grip the forging inside at the base end and inside at the nose respectively. Inside the hollow mandrel and extending the full length of the head-stock is a sleeve

which operates the rear set of shoes, and inside the sleeve is a shaft which operates the front set. The outside ends of



ASSEMBLY OF EXPANDING ARBOR FOR HOLDING 18-PDR. SHRAPNEL SHELLS.

shaft and sleeve are threaded right-hand and left-hand respectively, a hand-wheel threaded to suit operates both and thus tightens or releases the shoes in the arbor. The, chuck has a floating ring which is tightened on nose of shell and drives same.



BORING POWDER POCKET AND DIAPHRAGM SEAT, ALSO ROUGH TURNING OUTSIDE OF NOSE.

The forging is in the first place machined on the body near the base for about 1 in. length. This is done to permit the rollers on the next tool engaging with the forging in advance of cutting tool. It is also a means of ascertaining that the forgings will clean up all round. A cutter in first turret face performs this operation. The next tooling fixture rough turns the body of forging to within about three in. from end of nose. The tool is shown in operation in the illustration, and from which it will be observed that there are two steadying rollers attached to same fixture as the cutting tool. The third turret face holds a tool for finishing the base and body of shell as far as the groove. The fourth face holds a cup-shaped centre which engages with the base of forging and holds it steady while the tool in the holder on cross-slide cuts the groove. When turning the groove, sufficient metal is left to allow for the wave being finished later. At the end of this operation it sometimes happens that the base requires further machining to make it absolutely true, in other words, to correct the initial base cutting-off operation. To clean up the base, the forging is taken to a Jones & Lamson turret lathe equipped with a special cutter for this purpose.

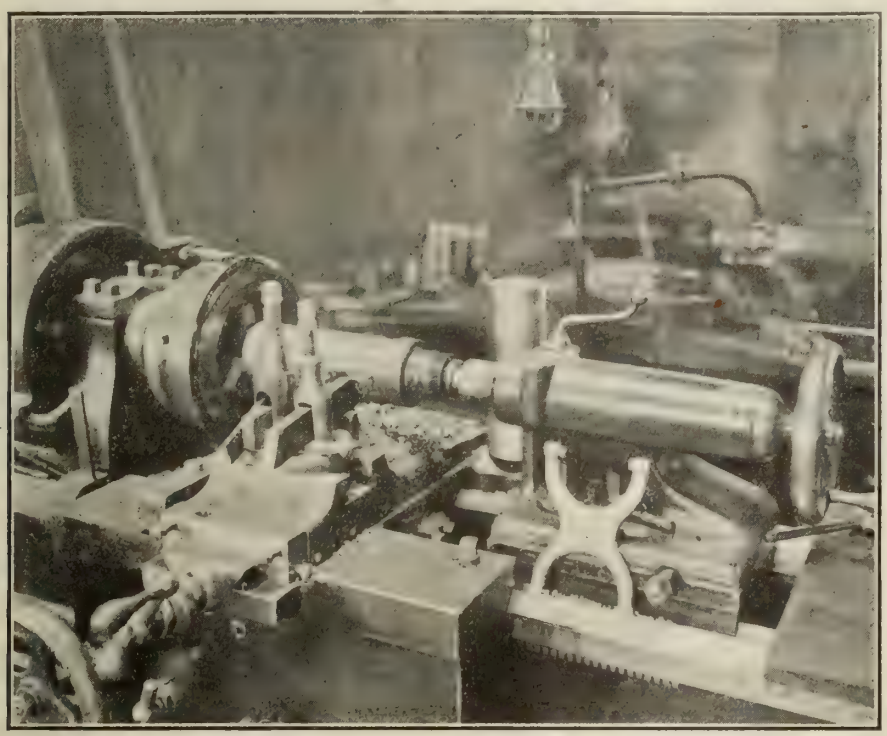
**Boring Powder Pocket and Diaphragm.**

The fourth operation consists of boring the powder pocket and diaphragm seat, rough turning outside of nose taper and, if necessary, facing end of the forging to the correct length. This operation is performed on a Potter & Johnston automatic machine. A Davis turret lathe is also used for this operation. The

BANDING PRESS.

tooling is the same in each case, but, of course, the operation of the turret is characteristic of the respective types of machine. The forging is held in a special chuck, the gripping dogs being inside, and at the front is a ring for keeping the forging central.

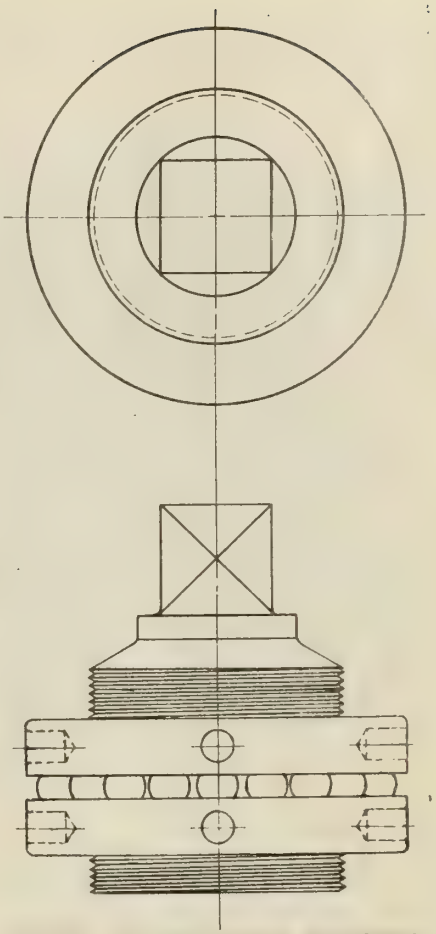
The first turret face holds a boring bar with two small cutters for rough turning the diaphragm and powder pocket sides. At the same time, the back half of nose is rough turned by a tool held in a holder on the cross-slide at the back. The slide is at an angle to give the desired taper and a fixture on the turret forces the tool along at the same speed as the boring bar. The second turret face holds a boring bar fitted for finishing the diaphragm sides and seat. On the turret face at the side is a tool which rough turns the front half or nose taper. The third turret face holds a tool fitted with a radius cutter for finishing the powder pocket. The forging is now gauged for correct size of powder pocket and diaphragm.



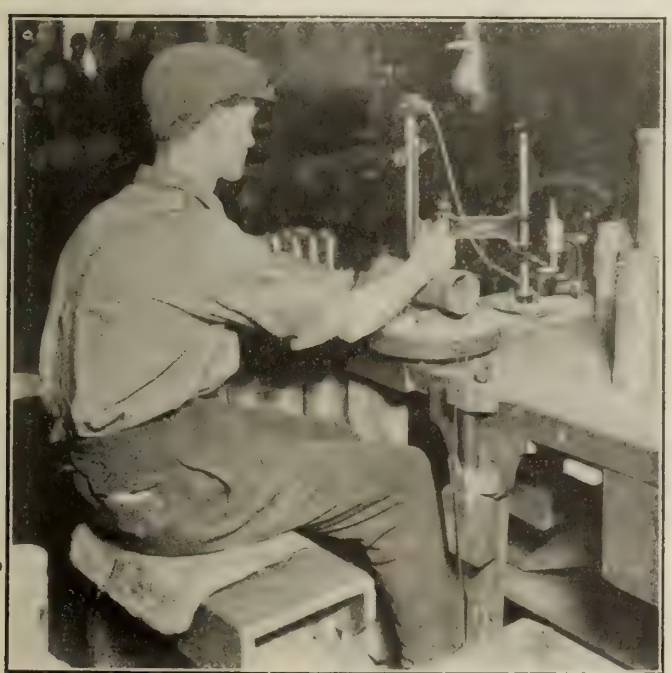
GROOVING AND WAVING OPERATION.

### Waving and Undercutting Groove.

At the next operation, the waving and under-cutting of the groove is done to take the copper driving band. A Reed engine lathe is utilized for this work, equipped with special attachment. It will be observed from the illustration that the tool-holders are side by side and that the forging is held in a universal chuck fitted with a cam to impart the necessary oscillating motion to the



SOCKET NUT FOR 18-PDR. SHRAPNEL SHELLS.



TESTING FOR HARDNESS WITH "SHORE" SCLEROSCOPE.

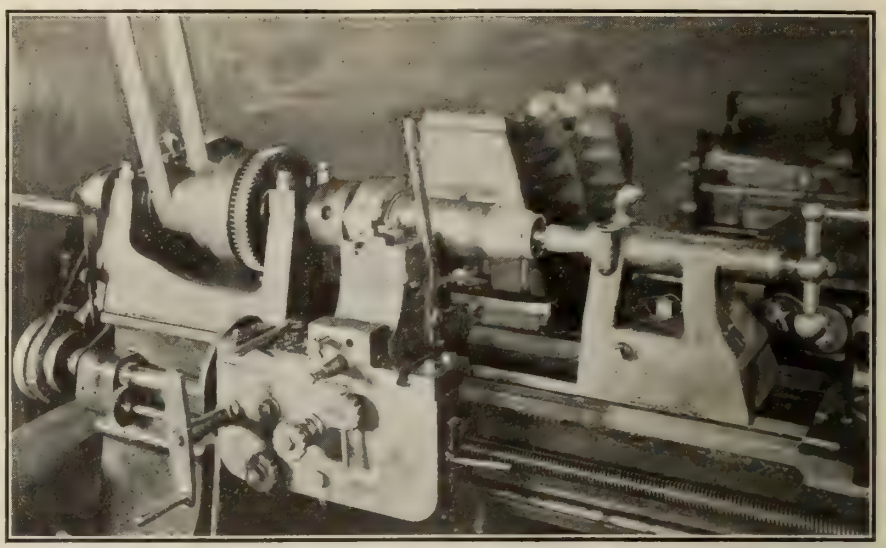
SHELL NOSING OPERATION.

saddle during the waving process. When setting the forging in the lathe, care is taken to have the groove in correct alignment with the tools. It will be noted that the base is supported by a carrier on tail-stock centre. One side of groove is first under-cut, then the other side, the same tool being used. The stops at front of the cross-slide regulate depth of cut. The saddle is then moved into position for waving. A roller projects from the saddle and is held against the cam by a weight and spring attachment which causes the saddle to oscillate and imparts the contour of the cam to the wave. The right-hand tool is used for waving and the stops already referred to control depth of cut.

### Heat Treatment.

The practice followed on this plant is to have the maximum degree of hardness allowable at the set-up point, which is 1½ in. from inner side of groove, and is the point of greatest stress. By this means, the shell is made gradually softer towards the ends, particularly the nose. To obtain this result the shells are heated twice in the tempering process, each end being treated separately. A Canadian Hoskins' electric pyrometer is used in connection with the furnaces.

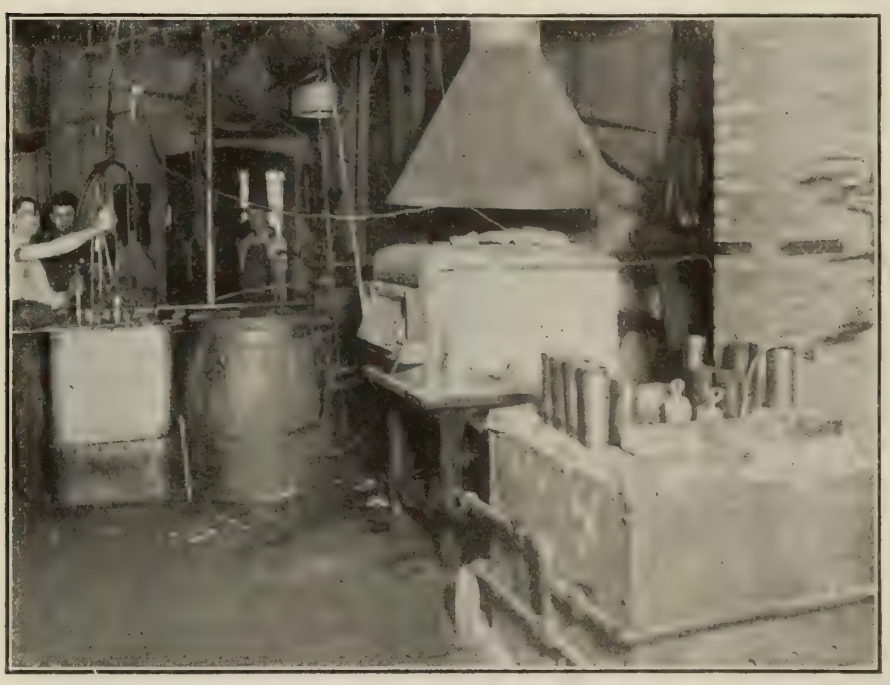
For the hardening process, the shells are heated in a Chapman gas furnace at a temperature of 1,600 degrees Fah. for about four minutes. The furnace contains molten lead and the shells are inserted base down and immersed in the lead within a short distance of the nose. They are cooled in an oil tank equipped with a special holding carrier which enables them to be moved about in the bath to equalize the cooling effect of the oil. The illustration shows the carrier after being lifted out of the bath after the shell has been cooled. The degree of hardness at this stage is between 60 and 75. The shells are now dipped in a soda bath to remove all traces of oil.



OUTSIDE BODY FINISHING.

### Tempering.

In the tempering process, the same type of furnace is used. The shells are first placed in the molten lead nose down for about half a minute. They are then reversed and put in base down for about the same length of time. In both cases, the shells are immersed to within about ½ in. either way of the set-up point, and the heat from the treated sections gradually spreads towards the set-up point, this giving the required degree of hardness. The limits for hardness at the set-up point now range between 45 and 53 on the scleroscope.



HEAT TREATING DEPARTMENT.

### Scleroscope Test.

After heat treating, the base of shell is polished on a grinder in order to detect any cracks or flaws that may have originated during the forging process. The shell is now tested by the scleroscope at the set-up point for hardness. The method used is the three-point suspension, a narrow V-block being placed under the set-up point and an ordinary rest at the nose end. By this method the shell is supported directly under the point where the blow of hammer falls and the shell rests solid on the V block, thus tending to give a more consistent reading on the scale. The scleroscope in this case has the air valves operated by a foot attachment thus leaving the operator's hands free. A test piece is machined out of one shell of each batch and sent off to be tested by Government inspector.

### Nosing Operation.

The next operation consists of closing in the nose which is performed on a large power press. The nose end of shell is first heated in molten lead in a gas furnace seen to the right of the illustration. The diaphragm is next dropped in and shell placed in the press. A hollow cone shaped die attached to the ram on descending closes in the nose.

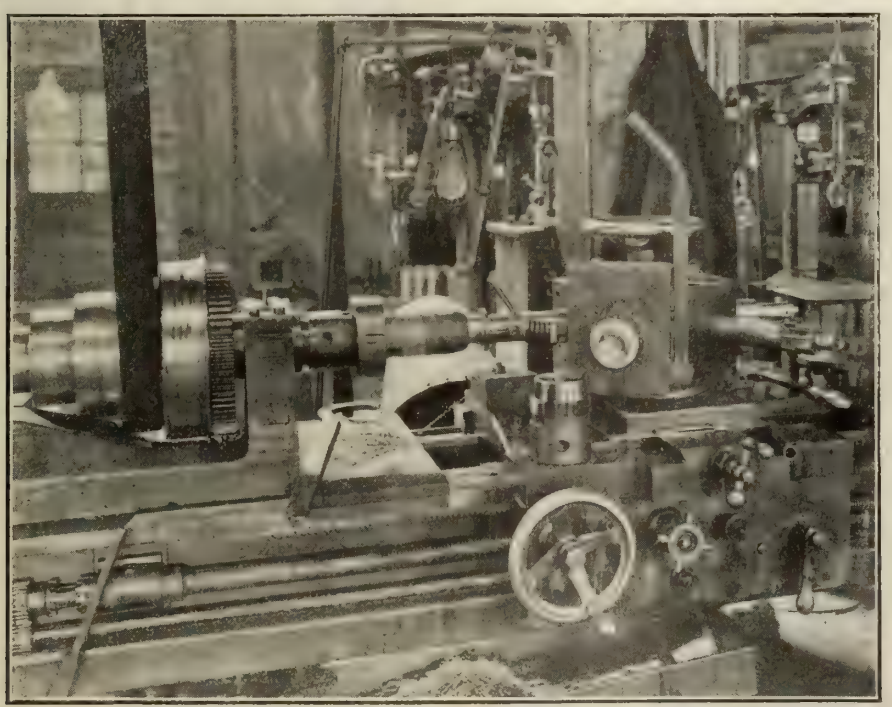
### Turning and Threading Inside of Nose.

A Flather engine lathe fitted with a turret is used for turning the inside of nose and threading same. The shell is held in a collet chuck, part of which will be seen on the slide in the illustration. The first tool machines the inside face of nose, and the second tool faces the end of shell to correct length. The third tool, the square shaped fixture in front on the turret, bores the inside of nose body. The boring bar is fitted with cutter and on the bottom of the fixture is a roller for engaging with the cams

shown fastened to the bracket on the lathe bed between projecting ends of saddle. When in operation the handle shown on the fixture holds the roller up against the cam and so follows the cam outline which gives the desired form to the nose. The fourth tool is seen in operation in the illustration and is a collapsible die for threading nose.

**Rough and Finish Turning Body.**

The next two operations are practically identical being performed on the same type of machine, namely a standard engine lathe equipped with a special attachment. In one lathe a roughing cut is taken on the body and nose, followed by the finishing cut performed in the same manner. A threaded centre is screwed into the nose and the base held in a collet chuck. The correct profile of the shell is taken care of by the cam attached to the lathe bed and shown in the illustration between the saddle and tailstock. The tool holder is attached to the cross slide and the vertical lever pivoted to the saddle is used for drawing the tool back from the work. To the back of saddle is attached a weight hanging over the lathe bed. This weight holds the roller attached to the slide rest, up to the cam, the tool thus following the direction given by the cam. The saddle is operated in the usual manner by the lead screw. The finishing operation is performed in exactly the same manner except that the cut is of course lighter.



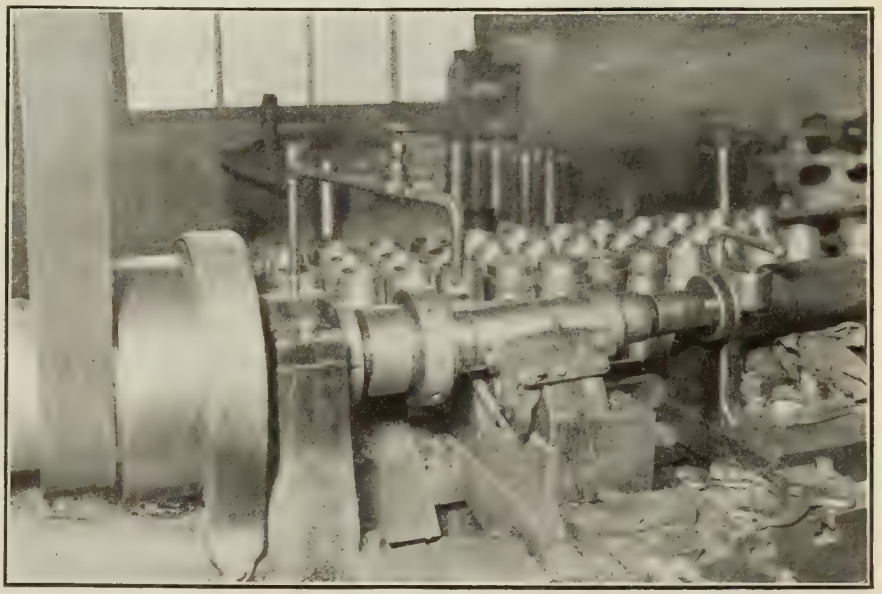
TURNING AND THREADING INSIDE OF NOSE.

**Grinding.**

An alternative operation has been adopted for the finishing cut which has materially increased the output. This consists of a Ford-Smith grinder equipped with a special grinding wheel made to the same shape as shell body and nose as will be noted in the illustration. The shell is held in a chuck and threaded centre, and is revolved by belt on the left, the grinding wheel being operated by belt on right hand.

**Inspection and Marking.**

The shells are now gauged all over and weighed, and are then taken to the Holden-Morgan marking machine where the markings are stamped on the body. This is a simple operation. The shell is laid on two horizontal rollers and a circular steel stamp is pressed on the body by means of a vertical hand screw. The die is given an oscillating motion through a pulley and belt, the travel of the die being sufficient to make the necessary markings. The shell is now thoroughly cleaned and taken to the band press.



TURNING AND FINISHING COPPER BAND.

**Copper Band Pressing.**

The next operation consists of pressing on the copper driving band. A hydraulic press equipped with special fixtures designed by the Chapman Double Ball Bearing Co., is used. The power for the press is obtained from a continuous running, belt driven, pump located conveniently. The copper band is first fitted into the groove. The shell is then placed in the press, band end up, with nose resting on the spacer. Power is applied to the ram underneath the table (see illustration) which rises and forces the steel taper wedges, eight in number up into the hollow conical steel casing at the top. The wedges conforming to the required circle are thus pressed in equally against the copper band. The pressure is then released, the table falls and the shell is readily taken out. The press is operated by lever shown at left hand side, the pressure gauge being located behind.

**Copper Band Turning.**

The copper band is machined on an ordinary engine lathe, the base of shell being held in a collet chuck and the nose end in a bell centre. The slide rest has back and front tool fixtures with tools made to the shape of the band. The back tool makes the roughing and the front tool the finishing cut. The stops shown in front of slide regulate the feed of the roughing cut and a similar stop at the back performs a similar service for the finishing cut.

**Assembling.**

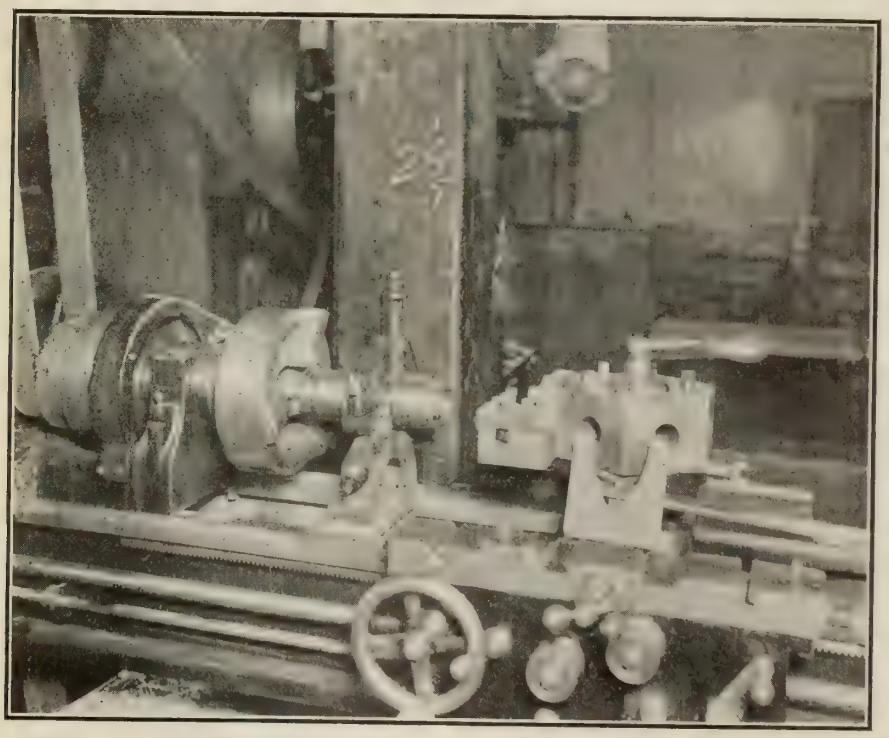
The shell is now ready for filling and for this purpose is taken to a bench.

where the powder cup is first dropped in and fuse tube screwed into the diaphragm. The shrapnel bullets are then poured in, a special vibrator being em-

GRINDING OUTSIDE OF SHELL BODY.

ployed for packing them closely. The shell is now weighed after which hot resin is poured in, small shot being used to adjust the weight.

The next operation consists of screwing in the brass sockets. For this the



MACHINING BRASS SOCKETS ON SHELL NOSE.

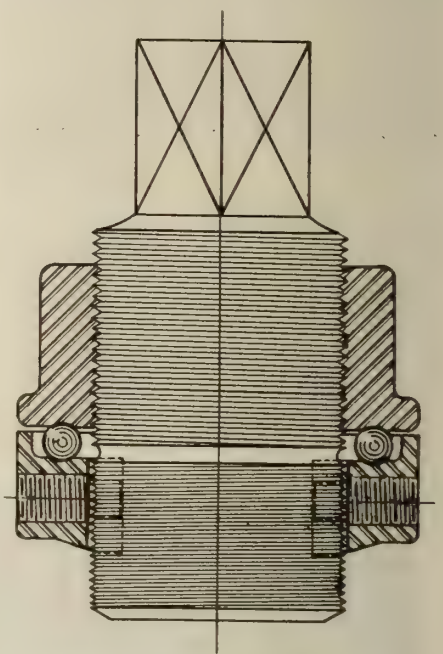
shell is held in a special bench chuck and the socket screwed in by means of special ball bearing tightening nut. This nut was designed by the Chapman Ball Bearing Co., as was also the extracting nut for use in the event of any socket having to be removed which, however, is not often the case. The fuse tube is next soldered to the socket which completes the assembly.

### Turning Sockets.

The next operation consists of turning the outside of socket to conform to the contour of nose. An engine lathe equipped with a turret is used for this work. As will be seen from the illustration, the shell is held in a universal chuck with a carrier on lathe bed to steady the shell. One cut is made to gauge shown on slide rest. In the next operation the inside of socket is cleaned up and end of fuse tube cut off. This work is done on an engine lathe with ordinary tool holders and carrier for shell as in the previous operation.

### Final Inspection and Painting.

The shells are now cleaned and handed over for Government inspection where they are weighed and gauged, and the brass plug put in. The final weight must be within four drams either way. The final operation consists of painting the shells. For this purpose a revolving cup is installed on a bench into which the shell is put with the nose down, and



EXTRACTING NUT FOR 18-PDR. SHRAPNEL SHELLS.

painted while revolving. A gauge on bench regulates the width of red band on nose.

### General.

In conclusion reference must be made to the handling of the shells between the various operations. In the majority of cases machine shops have been adapted to the manufacture of shells and not laid out specially for this purpose. It therefore follows that the machines are not always installed in their proper positions to correspond with the sequence of operations. This necessitates considerable handling and often unavoidable loss of time. This loss, however, has been considerably reduced by the use of trucks made by the Chapman Double Ball Bearing Co., these trucks having several features which make them of great utility, especially when being operated in confined spaces.

Throughout all the operations, the shells are carefully gauged with limit

and various other types of gauge to ensure the greatest possible accuracy. The final weight of the shells must be very exact, it therefore follows that great care must be taken in all the machining operations to have the tools set accurately so that the shells conform to the gauges which are made to fine limits.

SHELL TRANSPORTATION EQUIPMENT SHOWING ELEVATING TRANSFER TRUCK

## ESSENTIAL PRINCIPLES OF ENGINE DESIGN.

A COMPREHENSIVE paper, entitled the "Essential Principles of Engine Design," was read before the Manchester Association of Engineers recently by Mr. Frank Foster, M.Sc. The author submitted certain considerations and data suggested by practical experience, with the object of supplementing and modifying text-book information, so as to render it more practical and more in accordance with the tendencies of modern engineering progress. The paper brought forward three main lines of thought which the author considered engineers would find valuable in practice, namely:

(1)—The law of similarity, which might be stated generally as follows: Similar machines copies of each other to different scales and working under like conditions were equally strong in all parts, and gave similar quality of operation.

(2)—By attention to details, particularly in valves and valve gears, speeds of rotation could be increased so as to secure to a considerable degree the merits of a high revolution speed without giving up the special features which had made the slow-speed reciprocating engine the standard, where the best in respect of economy, durability, reliability and quality of operation were desired.

(3)—Each detail of engine design was worthy of and would amply repay close, patient, scientific and workshop study.

### Principle of Similarity in Design.

Pursuing the above lines of thought, more especially with reference to the development of a line or series of engines of one type, the paper was divided into a number of sections, commencing with one on the principles of similarity, which the author considered should at least be the basis of the whole series of designs, instead of as was usual at present, each design being a strange piece of original patchwork laboriously contrived with the aid of as many parts from other designs as it was possible to make use of. Taking a concrete case, the author said that if one engine was copied from another in all details, but to a different scale, and worked at the same piston speed and under the same steam pressure, it would have precisely the same strength in all parts as the corresponding parts of the original engine.

Whenever another size of engine had to be designed it was made as a copy of the standard, but with all dimensions increased or diminished in a certain ratio. This ratio was determined by the power of the engine. Thus, if the standard engine happened to be 750 indicated horse-power at 80 revolutions per minute and 4-ft. stroke, an engine of 1,160 indicated horse-power would run at 64 revolutions per minute and have a stroke of 5 ft. The ratio of the strokes was found to be 1.25. Then every dimension of the new engine would be 1.25 times that of the standard. The weight of the new engine was greater than the weight of the standard in the ratio of the cube of 1.25—that was, in the ratio of 1.953—whilst the power was greater in the ratio of the square of the primary or stroke ratio—that was, in the ratio of 1.562. Thus, the standard engine power being 750 at 80 revolutions per minute and 4-ft. stroke, and the new engine 1,160 indicated horse-power, the ratio for the scales was—

$$\sqrt{\left(\frac{1160\ \text{I.H.P.}}{750\ \text{I.H.P.}}\right)} = 1.25.$$

The new engine was consequently an exact copy of the standard, but with every dimension increased 25 per cent. and its weight increased in the ratio of 1.25 cubed, or 1.953. The copying process, it was explained, served for all details, including metal thicknesses and bolt sizes.

### Catalogued Machinery and Design Similarity.

The author then proceeded to analyze examples of machines listed in published catalogues to see whether the designers had consciously or unconsciously adhered to the law of similarity. The articles dealt with included steam-driven, air and circulating pumps, superposed compound steam engines, large continental gas engines, small horizontal gas engines. From a study of these examples, the author concluded that as regards weights and strengths the rule of similarity gave perfectly satisfactory working engines of the same type, but widely different sizes, and that there was no inherent necessity for the extra weight frequently put into small engines.

Discussing the reasons for departure from the rule of similarity, the author gave the following:—(1) No conscious attempt to adhere to it; (2) a designer accustomed to a limited range of scantlings instinctively feared to adopt others very much thinner, even for proportionately smaller machines; (3) molders demanded a margin for contingencies, meaning chiefly their own lack of adaptability and limited range of manual skill; (4) the tradition in general engineering shops that the British fitter was too clumsy to be trusted with a spanner or bolt less than ⅜ in.; (5) on rubbing surfaces certain allowances were made for wear which were not strictly proportionate to the scantlings; and (6) allowances for corrosion. Reviewing the above reasons, the author maintained that departure from the rule is only justified by lack of skill.

### Modifications Relative to Similarity.

Admitting that for the time being strict adherence to the rule of similarity

was rarely possible, the author then laid down the modifications which seemed desirable:

(1)—A standard engine of fair size should be accurately designed in all its details.

(2)—The leading dimensions of this standard should be so chosen with reference to the smallest and largest of the series that the rule of proportionality applied to the overall dimensions and leading "centre to centre" dimensions.

(3)—The stroke of the engine should be the starting point and the cylinder diameters should be as nearly as possible in strict ratio with the stroke.

(4)—The details should follow the law of similarity, except that, where thought necessary, the ratio might be slightly increased or decreased to meet the obstacles already mentioned. Thus, if for a small engine the true proportionate ratio were 0.4 and it were deemed desirable to strengthen the parts by 20 per cent., the linear dimensions should be increased 10 per cent. so that the factor became 0.44. For instance, if the standard engine cylinder metal, frame thickness, piston-rod diameter and main neck diameter were respectively 1.5 in., 1.3 in., 6 in., and 16 in., the corresponding dimensions on the smaller engine became 0.66 in., 0.57 in., 2.64 in., and 7.05 in.

(5)—One objection to the change of ratio described above was that it tended to overthrow certain of the overall dimensions unless these were unduly liberal on the standard engine. This became important where the number of sizes was large, and called for a modification in one or two dimensions. It did not, however alter the main course of procedure in designing and estimating.

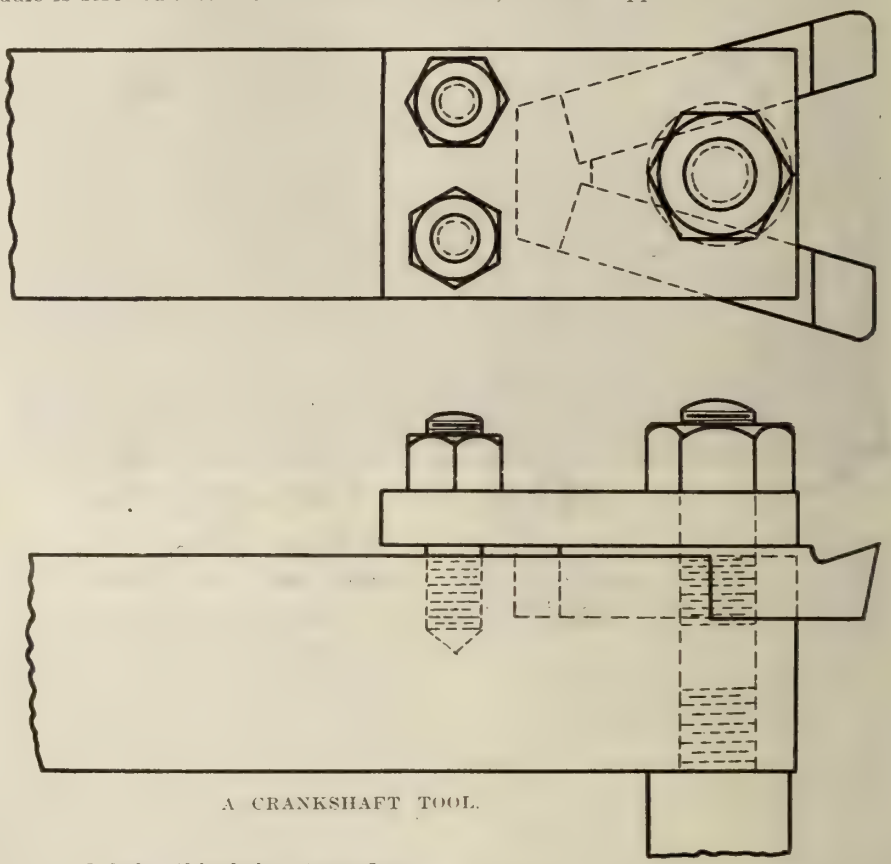
The remainder of the paper dealt with steam consumption, indicator diagrams, cylinder ratios, stresses, frames, flywheels, bearings, pistons, foundations, materials of construction, and commercial and market considerations. — The Engineer.

## A CRANK SHAFT TOOL.

By D. S. Mann.

IN the illustration is shown a convenient lathe tool for turning the inner sides of the cheeks of gas engine crank shafts. The usual practice is to rough down either side with a right and left-hand tool, taking each cut separately, and, when the lathe is sufficiently heavy to pull the two cuts, considerable time is saved by the use of the double tool. It is also possible to make this tool much heavier and stiffer than the single tool.

Making the cut on both sides serves to take up the thrust of the tools, balancing same, so that the tools cannot be pushed out of the cut with consequent chattering. The tool bits, being set in at an angle, have quite a bit of adjustment for width of cut, although it is preferable to have a separate tool for each size of shaft. With most of the shafts now used it is only necessary to take a roughing cut down the inside. The length of the shank of the tool, of course, depends upon the throw of the crank being turned, and may be of cold-drawn steel of the proper size. Maintenance in position is by means of two bolts and a heavy strap, while a heavy post of the proper length to rest on the saddle is screwed into the bottom of the front stud hole, this being tapped entirely through, forming a very rigid combination, and one which will give satisfaction.



A CRANKSHAFT TOOL.

While on the subject of crank shafts, the general practice when turning the body of the shaft is to use a small jack or screw between the cheeks to prevent springing-in. This jack is often set up a bit too tightly, thus doing the very thing it is designed to prevent. The writer has found that a better method is by the use of two heavy strap clamps, these being placed across the cheeks and tightened up before the shaft is placed in the lathe. A good idea is to have a serrated hardened plug in each end of the clamps, so as to secure a good "bite" on the sides of the cheeks; a sharp-pointed screw may also be used. Two clamping bolts, close to either side, will not tend to bend the clamps as readily as one bolt in the centre.

## EMBARGO ON METALS RELAXED.

A RELAXATION of the rigid regulations governing the exportation of Canadian goods to guard against their finding their way to the enemy is taking place along certain lines. In certain cases, where deemed advisable, the Customs Department is issuing special licenses allowing the exportation of certain articles otherwise prohibited in the recent revision of the enemy trading proclamations.

A notable instance is in the case of ores, such as copper and lead. Their exportation to the United States is being allowed under special license where it is established that they will not ultimately find their way into the hands of the enemy. As a rule, licenses will be issued to permit the exportation of goods now allowed to be exported only to British territory to the Allies as well. Other such licenses will be issued permitting export to the United States. These licenses are not issued to all shippers, but only to those who can be trusted to see that the goods exempted do not reach hostile countries.

Large quantities of goods shipped contrary to the regulation have been, and are being, turned back at the border. So far the practice has been simply to hold them up, neither confiscation nor prosecution following. All this has meant a considerable additional volume of work for Canadian Customs officials.

# Series of Practical Questions and Answers for Mechanics

*Every care is being taken to include only pertinent, practical questions, and give same direct reliable answers. Catch questions will be avoided. Arithmetic, consisting of simple addition, subtraction, multiplication and division will be found a useful companion study.*

## PROJECTILES.

A PROJECTILE is any body that is thrown into the air; in other words, it is moved partly or wholly by an impulse that has been given to it. Any projectile is acted upon by two forces—namely, the original force of projection which tends to keep it moving with a uniform motion in a straight line and the force of gravity which gives it an ever increasing velocity towards the centre of the earth. A base-ball thrown by the hand, a stream of water from a nozzle, a rifle bullet and a shell from a cannon are common examples of projectiles.

The trajectory of a projectile is the height to which it rises above the point of discharge in order to cover a specified distance. For instance, the trajectory of the British service rifle at a range of one mile is 17 feet, while that of the Ross rifle is somewhat less. The maximum height to which a projectile will rise is determined by its initial velocity and the angle at which it is projected. In the case of heavy ordinance, a high initial velocity is very destructive to the rifling of the gun, thus the life of a heavy, expensive gun would be greatly increased by using small powder charges and firing at a high angle rather than using heavy propelling charges with a low trajectory.

Theoretically the greatest range is obtained by discharging the shell at an angle of 45 degrees with the horizontal, but this is altered somewhat in practice by the resistance of the atmosphere and other causes. Where heavy naval guns are worked at extreme ranges, the shells necessarily go to a considerable height, so that they fall on the deck of the enemy ship rather than pierce her side armor. Under such conditions the range is the most important information to be obtained. It is comparatively easy to place a shot directly in line with the target, but another matter entirely to drop it at such a distance from the gun that it will fall on the deck of a ship. For this reason ship captains endeavor to attack each other at long ranges, broadside on rather than end on, as in the case of a pursuit. The study of projectiles is so closely allied to that of falling bodies that it will be in order to work a few problems pertaining to this branch of the subject.

* * *

**Question.**—A body moves at the rate of 2,400 feet per second. How far will it go in 2.72 minutes?

**Answer.**—In one minute, the distance traversed is $2{,}400\times60$. In 2.72 minutes the space passed over is $2{,}400\times60\times2.72 = 391{,}680$. In larger units this becomes

$$\frac{391{,}680}{5{,}280} = 74.18 \text{ miles.}$$

* * *

**Question.**—What velocity in feet per minute is equivalent to a mile a minute?

**Answer.**—A mile per minute equals 5,280 feet in 60 seconds, or is $\frac{5{,}280}{60} =$ 88 feet per second.

* * *

**Question.**—A bomb falls from an aeroplane at a height of 3,800 feet. How long will it take to reach the earth?

**Answer.**—Formula, $t = \sqrt{\frac{2h}{g}}$, in which t = time in seconds, h = height in feet, and g = force of gravity = 32.16 pounds. Applying the formula, $t = \sqrt{\frac{2\times3800}{32.16}}$ or $t = \sqrt{236.3184} = 15.37$ seconds.

* * *

**Question.**—An aerial scout shoots vertically downward at an enemy, but misses him, and the bullet strikes the earth. If the initial velocity of the bullet be 2,400 feet per second, and it is fired from a height of 5,240 feet, at what velocity will it strike the earth?

**Answer.**—To determine the velocity acquired by a body in falling from a given height, the formula is, $v = \sqrt{2\,g\,h}$, where v = velocity in feet per second, g = force of gravity = 32.16, and h = height in feet. In the above example, velocity $= \sqrt{2\times32.16\times5240} = \sqrt{337{,}036} = 580.55$ feet per second. The initial velocity of the bullet is 2,400 feet per second, therefore velocity with which it strikes the earth is $580.55 + 2{,}400 = 2980.55$ feet per second.

* * *

**Question.**—A pipe is under water pressure of 60 pounds per square inch. If a suitable nozzle be fitted and directed vertically upwards, neglecting friction, to what height will the water rise?

**Answer.**—The head of the water in feet $= \frac{60}{.434} = 136.17$ feet. Theoretically, the water would rise to the same height.

**Question.**—A dirigible going at the rate of 90 miles per hour wishes to drop a bomb upon an arsenal 3,000 feet below. How far from the perpendicular would the airship have to be at the time of releasing the missile in order to hit its mark, and at what angle to the vertical would the sight be set to accomplish this?

**Answer.**—The time required for a bomb to drop 3,000 feet is $t = \sqrt{\frac{2h}{g}} = \sqrt{\frac{2\times3000}{32.16}} = 13.66$ seconds. When going 90 miles, the speed per second $= \frac{90\times5280}{60\times60}$ = 132 feet per second.

In 13.66 seconds the distance traversed is $132\times13.66 = 1803.12$ feet—that is, the missile would travel this horizontal distance after leaving the baloon.

The vertical distance being 3,000 feet and the horizontal distance being 1803.12 feet to the target at the time of discharge, the tangent of the angle will have to be $\frac{1803.12}{3{,}000} = .60104$. From a table of tangents we find this angle to be 31° 1′, or approximately 31 degrees.

* * *

**Question.**—If the muzzle velocity of the British service rifle is 2,200 feet per second and that of the Canadian Ross is 2,600 feet per second, what would be the difference in the range when the shots are discharged horizontally, four feet from the ground?

**Answer.**—Neglecting air resistance, the time required by the bullet to drop 4 feet $= t = \sqrt{\frac{2h}{g}} = \sqrt{\frac{8}{32.16}} = \sqrt{.2487} = .498$ second. At the rate of 2,200 feet per second, the distance traversed in .498 second $= 2{,}200\times.498 = 1095.6$ feet. With a muzzle velocity of 2,600 feet per second, the range will be $2{,}600\times.498 = 1294.8$ feet.

* * *

**Question.**—An airship is 300 feet long, and is flying a mile high at the rate of 80 miles per hour. Assuming that the muzzle velocity of an aero-gun projectile is 2,800 feet per second and that the shooting is practically in a vertical direction, how far ahead of gas bag should the gun be aimed?

**Answer.**—The total height to which the projectile will go $= h = \frac{v^2}{2g} = \frac{2800 \times 2800}{2 \times 32.16} = 121{,}890.5$ feet, and the time required to make the total height is $\sqrt{\frac{2h}{g}} = \sqrt{\frac{121890.5 \times 2}{32.16}} = 87.06$ seconds. The difference between the height of the balloon and the maximum altitude of the projectile is 121,890.5—5,280=116,610.5 feet. The time required by the projectile to traverse this distance is $\sqrt{\frac{116{,}610.5 \times 2}{2 \times 32.16}} = 85.15$ seconds.

The time taken by the shell to reach the balloon is $87.06 - 85.15 = 1.91$ secs. A rate of 80 miles per hour gives a speed of $\frac{80 \times 5280}{60 \times 60} = 117.3$ feet per second.

The distance traversed in 1.91 seconds is $117.3 \times 1.91 = 223.043$ feet. If the gunner aimed about one-third of a length ahead of the airship, he would probably hit it in the centre.

* * *

**Question.**—The maximum angle of elevation of a British naval gun is 15 degrees. If the muzzle velocity of the shell is 2,400 feet per second, what is its maximum range?

**Answer.**—The horizontal velocity of the projectile is 2,400×cosine of 15 degrees = 2,400×.96593 = 2318.23 feet per second.

The initial vertical velocity = 2400× the sine of 15 degrees = 2,400×.25882 = 62.17 feet per second.

The height to which the shell will go will be $h = \frac{v^2}{2g} = \frac{621.17 \times 621.17}{2 \times 32.16} = 5998.94$ feet.

The time required to rise to this height is $t = \sqrt{\frac{2h}{g}} = \sqrt{\frac{2 \times 5998.94}{32.16}} =$ $\sqrt{373.06} = 19.3$ seconds.

The time required to go up and come down is $2 \times 19.3 = 38.6$ seconds, which is the total time of flight. The range or distance traversed = $2318.23 \times 38.6 = 89483.678$ feet, or 16.94 miles.

**Propeller Flutter.**—The vibration of the wooden blades of aeroplanes is termed "propeller flutter." The air resistance of a propeller is proportionate to the blade thickness, and, as the flutter is equivalent to an increased blade possible. A great deal of the success of the Gnome engine is due to the fact that its smooth running reduces flutter to a minimum.

## ELECTRIC DRIVES FOR LATHES.

IN order to secure maximum and best output from modern tool steels and machine tools, it is necessary, says a writer in "Electricity," that the cutting and feed speeds be proportioned exactly to the materials and operations concerned. Electric driving makes possible accurate and continuous speed control over a wider range than can be compassed by any other means applicable to machine tools, and this in itself is a most important factor in determining the value of electric motors in machine shops.

To take a particular example, a five-step cone pulley and back gear driven from a constant speed line shaft gave, in a certain lathe, spindle speeds of 9, 15, 25, 40 and 60 revs. per min. with back gear in, and 110, 175, 300, 450 and 650 revs. per min. with back gear out; but, by substituting a shunt wound motor (with 2 to 1 speed range by field regulation) for the line shaft drive, absolutely continuous speed regulation was obtained from 9 to 12,000 revs. per min. The practical advantage of this complete and accurate speed gradation needs no emphasis.

### Alternative Systems.

In any workshop where it is proposed to employ electric motors two alternative systems have to be considered. Each machine tool may be driven by its own motors or a number of tools may be belt driven in the ordinary way from a line shaft which is itself electrically driven. Group driving is particularly useful where a number of machines of similar type are in service at the same time and can be driven from a relatively short line shaft, sufficient speed control being obtainable by belt and cone pulley driven from the line shaft, the speed of which is kept constant.

For group driving, a standard shunt wound direct current or squirrel-cage induction motor is suitable, and the motor is considerably lighter than one with widely variable speed. Further, where group drive is practised, the motor horse-power required is less than the sum of the horse-powers of motors used for individual driving, the reason being that, when each tool has its own motor, the latter must be powerful enough to overcome the starting or other high temporary resistance of the tool, whereas, in a group-driving system, the percentage value of individual peak loads is much reduced, and the peaks on some machines are often compensated by reduced demands on the others.

For individual driving of machine tools there may be used either a variable speed motor directly belted or geared on to the machine, all speed variation being obtained by regulating the motor field; or an induction motor or a standard shunt motor, with change-speed pulleys or gears for coarse speed regulation, and 2 or 1½ to 1 field variation for fine speed adjustment. In the former case, a semi-enclosed, interpole shunt motor is suitable and provides high torque and wide speed variation with little sparking at the brushes.

Where the whole speed range is obtained by motor regulation, rapid speed changing is possible over the whole range, and complex and cumbersome mechanical change-speed devices are unnecessary. On the other hand, a shunt motor with small speed range by field regulation is a lighter and cheaper machine, and, by combining it with change-speed pulleys or gears, very wide speed range can be covered with little trouble or delay. This arrangement is at once applicable to any existing or new machine tool designed for line-shaft driving. The flexibility and smooth running of the belt drive are important advantages and vibration is much less pronounced and injurious than it is apt to be if the motor be gear coupled and mounted on the frame of the machine tool itself.

### Horse Power Feature.

As regards the horse-power required, this varies enormously with the design of the machine tool and the exact materials and speeds concerned. By driving the tool temporarily by a motor which is certainly too large, the best working conditions can rapidly be determined and the power requirements measured electrically. This is a matter for the machine tool makers (except in cases of converting drives), but there is still noticeable a tendency to use motors of too low horse-power.

The introduction of special alloy steels has led to cutting speeds of from 80 to 160 ft. per minute, and finishing speeds up to 200 ft. per minute, and the quadrupling of the speeds formerly used for carbon steel demands an increase in driving power, the magnitude of which is apt to be overlooked where machines are driven in groups from line shafting and spare power is available and frictional losses high, so that a percentage increase in the useful power is less noticeable.

**Hardening Hammer Face.**—To harden hammer face, heat the hammer to a bright red all over, dip the face into the bath about ¾ in., moving it about the surface the while about half a minute, remove from bath and rub the face bright, dip the nose of hammer about ½ in. till the face has drawn to a deep straw color, then cool the face and draw the nose down to blue, and cool altogether. If done properly, a hammer tempered in this way will be right for years.

# PROGRESS IN NEW EQUIPMENT

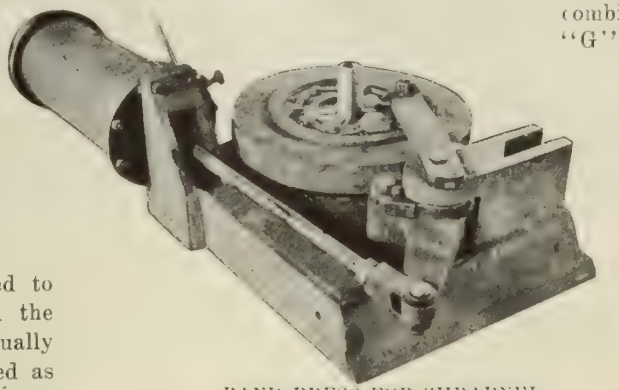
A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## BAND PRESS FOR SHRAPNEL AND HOWITZER SHELLS.

IN connection with the manufacture of shrapnel and howitzer shells a banding press has been designed and is being built and put on the market by the Jenckes Machine Co. of Sherbrooke, Que., for the purpose of pressing the copper band into place in the grooved recess on the shell body.

The base or stand of this press is a heavy substantial grey iron casting, with a raised portion on which a ring rotates. This raised portion is slotted for six steel plungers, which are machined to bear on wedge-shaped recesses in the ring. The inner dies which actually press the copper band are machined as one piece, and afterwards cut in six sections, these being loosely pinned to the plungers to keep them in their relative positions. The plungers are all returned after the movement of the ring by means of the springs shown. The main lever and the toggle lever are steel castings.

The whole arrangement is operated by means of a 12-in. air hoist cylinder, controlled by a four-way valve, which permits quick and positive action. The air hoist cylinder is riveted to the main base in such a way that the cylinder carries the motion of the lever without any tendency to cram.



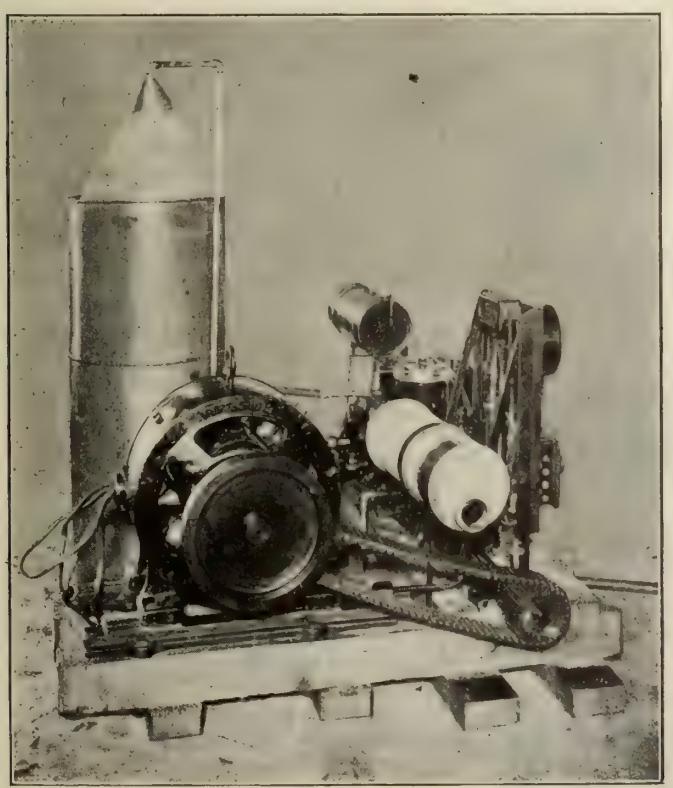
BAND PRESS FOR SHRAPNEL AND HOWITZER SHELLS.

## X-RAY OUTFIT FOR OVERSEAS EXPEDITIONARY FORCE.

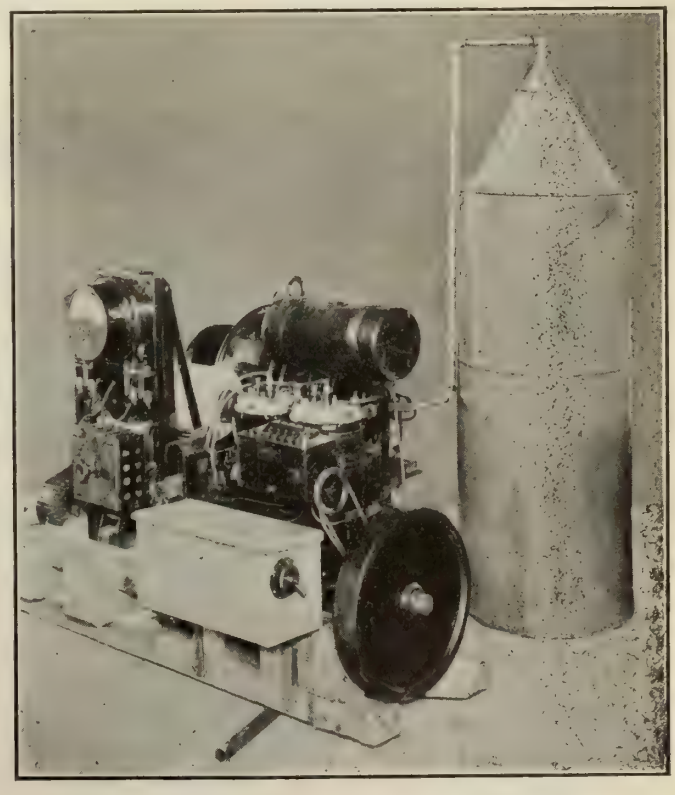
THE University of Toronto, No. 4, General Hospital, has recently had built for service with the Canada Expeditionary Force at the front, a semi-portable generating set for an X-ray outfit. This is a somewhat unique installation, and the accompanying illustrations show clearly the general lay-out.

The unit was constructed by the Canadian Fairbanks-Morse Co., of Toronto, and will be used to generate electric current for the X-ray machines. The combination consists of a 12-h.p. type "G" Fairbanks-Morse marine engine, arranged with throttling governor, coupled to a short steel shaft, having an outboard bearing, taking the chain pull. The generator is a 7½ k.w. direct-current machine, wound for 230 volts, and the drive is by means of a silent chain at 30-in. centres, current from the dynamo being delivered to a slate switchboard carrying the field rheostat and voltmeter. Two feeder-switches permit of handling two X-ray machines at the one time, and a Maxim silencer takes care of the engine exhaust.

It will be noted from the photographs that the engine is arranged with "Bosch" high tension ignition (duplex), and that the starting battery, switch and tools are all carried in one box securely fastened to the side of the en-



X-RAY OUTFIT FOR CANADIAN OVERSEAS EXPEDITIONARY FORCE.



X-RAY OUTFIT FOR CANADIAN OVERSEAS EXPEDITIONARY FORCE.

gine. A "Detroit" mechanical lubricator is fitted to all bearings. The fuel tank is carried on top of the outfit on the carburetor side and holds four gallons. The cooling of the engine is taken care of by a galvanized tank, 20 in. x 5 ft., with a cone-shaped screen at the top, the circulating pump taking the water from the bottom of the tank, and passing it through the engine jacket to the top of this screen, where it is aerated while passing back to the tank.

The entire combination unit is mounted on a scantling frame, and when crated has an over-all dimension of about 5 ft. 6 in. x 5 ft. 3 in., with a height of 36 in. The current produced is notably steady, and the plant, being self-contained, can be placed and put in operation in a few minutes.

## FOUR SPINDLE VERTICAL SQUARE-HEX ATTACHMENT.

THE illustrations here show a four Spring Vertical Square-Hex Attachment for Milling Machines, to take care of such work as hexing of spark plug nuts, squaring of screw or bolt heads, straddle milling, and all such classes of work as come within its capacity. The attachment can be arranged for holding the work either by double taper contraction collets, operated by a wrench as shown in Fig. 1, or on threaded arbors or plugs, as shown in Fig. 2, the pieces being run up tight against the hardened steel washers or collars by a special "Shaw" wrench, which is also used for taking off the finished work without bruising. Through the indexing handle, the four spindles, which are geared together, are turned to index for square or hexagon work, and the vertical lever shown, Fig. 1, below the attachment, is arranged to eject the finished work after unclamping the collets.

The attchment is made with a 1½ in. collet capacity, having a center distance, spindle to spindle, of 3 inches, and is an addition to the line of Multiple Spindle Index Centers of The Garvin Machine Co. New York City.

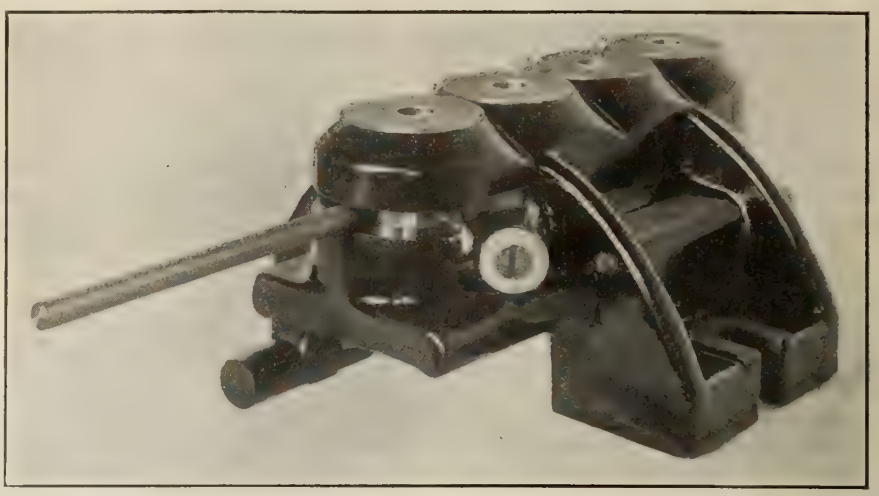


FIG. 2. FOUR-SPINDLE VERTICAL SQUARE-HEX. ATTACHMENT.

## DRIVING CONTACT OF TOOTHED WHEELS

IN good work, the principal driving of toothed wheels is effected by contact at and near the pitch line. When this is completely secured the amount of sliding upon the working faces of the teeth is almost negligible, and the resulting wear is insignificant in amount. in course of time, however, the loss of material becomes apparent, and the teeth begin to bear more upon the points.

Within moderate limits this is quite in order, but in some cases it may extend so far as to show the heaviest bearing near to the extreme points of the teeth, in which case such surfaces should be lightly chipped to clear, and thereby largely reduce the liability of teeth to break off at the root. By a firm adoption of this course many wheels have been saved from premature collapse, after repeated breakage of single whole teeth.

Concentration of pressure at either end of the tooth is also attended with liability to cause fracture. The cutting of wheel teeth in a reasonably good machine leaves the teeth practically true as to squareness with regard to the side faces of the wheel. Uncut teeth are, however, seldom very good in this respect, and any defect of this kind, obviously, leads to concentration of pressure at the ends, especially if the two wheels possess defects of this kind in opposite directions. It is therefore a point of simple prudence to keep the ends as well as the points chipped back far enough to avoid abnormal heavy bearing on the area affected.

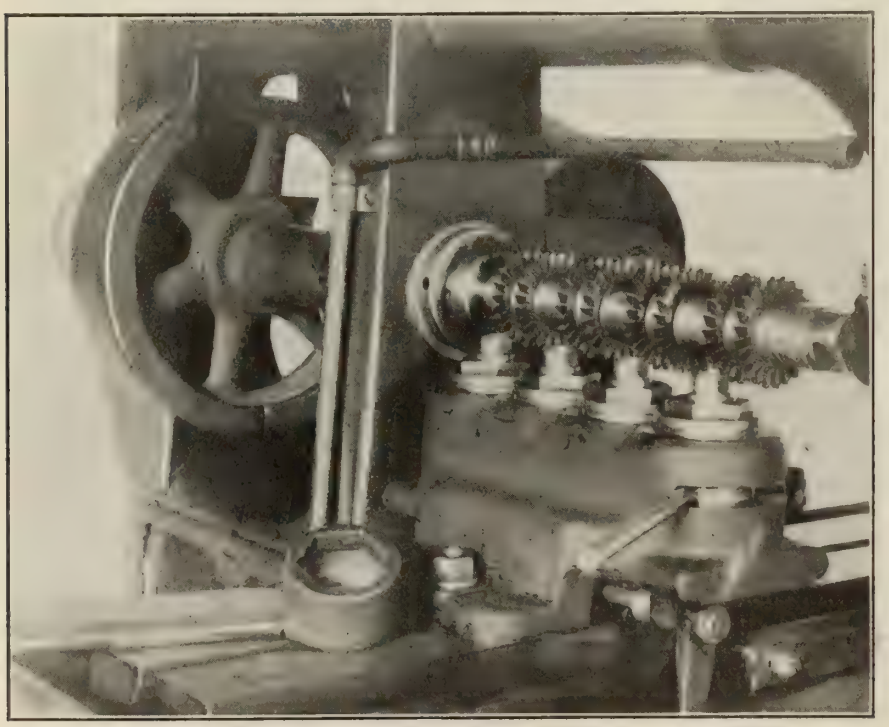

FIG. 1 FOUR-SPINDLE VERTICAL SQUARE-HEX. ATTACHMENT.

**Trench Periscope.** — An ordinary trench periscope can be constructed from two mirrors opposed and parallel to each other, and set at an angle of 45°. The eye of the observer should be kept close to the edge of the lower mirror. The image of the reflection varies in size with the distance between the two mirrors and, owing to light losses caused by the double reflection, is apt to be indistinct. It is hardly necessary to add that the periscope of a submarine is an instrument very much more complicated and effective.

*The display of practical patriotism, indicated in the accompanying extracts from the editorial columns of prominent Old Country technical journals, should be such as to inspire us to not only intensify our own individual effort in the cause, but dispose us collectively to leave no stone unturned in order that concentration and superlative efficiency be realized.*

## TEACHING THE MANUFACTURE OF WAR MUNITIONS.

THERE have been started at the Birmingham Municipal Technical School, says "The Engineer," special classes for the training of men and youths in the manufacture of war munitions to whom at present such occupation is wholly foreign. The idea is to assist in remedying the shortage of labor now so manifest in these trades. Already applications have been received from nearly 400 men who are desirous of assisting the country, and whose ages range from twenty-five to sixty years. It is hoped that after five or six weeks' instruction they will have learned sufficient to enable them to go into the factory.

### Has Government Approval.

The idea of the classes came from the head of the engineering department at the schools, Mr. Thomas Reid, who, after a consultation with the Education Committee, visited the Admiralty offices in London and Woolwich Arsenal. The Government gave its approval to the suggestion. The classes are being started with the object of rapidly training youths and men in the making of shells and fuse parts, and it is interesting to note that the work done in the schools is not to be experimental, all the shells and other munitions produced being used by the Admiralty. One of the shops at the Technical School is being set apart for the work, and machines are being removed to facilitate the operations. In future it may be found necessary to do the work continuously, and the moulding and casting may also be done at the schools.

It is understood that all the workmen who can be released from the employ of the Birmingham Corporation are to be taken over by the local Munitions Committee, with a view to their distribution among the firms requiring them who are engaged on the making of munitions for the Government, the total number being nearly 1,200. At some of the Coventry factories where munitions are being turned out, petitions have been sent to the managements requesting them to discharge all alien workmen, and at certain shops the men have only been persuaded to remain at work on the understanding that their wishes will be carried out.

## BARROW ASPIRES TO THE PENNANT.

BARROW, Eng., is very busy in the production of munitions of war, says the Liverpool Journal of Commerce, and more and more men and women are being engaged to do this work week after week. The Barrow Steel Co. have determined in the meantime to close their works to commercial business of any sort, and to devote their energies entirely to produce steel for shells, which are to be manufactured at Vickers' works and elsewhere. This will stop the Bessemer department of their works, but the rail mills, the merchant mills, and the plate mills will be kept busily employed with Siemen-Martin steel, and the men who will be thrown out of work will find employment in the various departments of Vickers' works.

### Canadian Mechanics in Barrow.

A large number of men who are above enlistment age have arrived at Barrow from Canada, and they have started work at Vickers' yard. It is expected some hundreds of girls from France will shortly arrive at Barrow for war munitions work, and numerous additions to workpeople, men, women and girls are being started every day. The new shell shop is so far advanced that work is in operation in several of its departments. It will soon be ready for full work, and, when that is possible, some 2,000 hands will be employed in this shop alone, all engaged in making munitions of war.

### Shipbuilding Secondary.

Much more attention is being devoted to the making of munitions of war than to the building of ships. The shipyard side at Vickers' works is running short of orders, and men who have been employed in plating, riveting, and other trades connected with shipbuilding are removing to other places, where work is more plentiful.

Barrow at the present moment is one of the busiest towns in the country engaged in munitions of war, and before many weeks are over there will be a vast increase in its production capacity. All employees engaged in this work are busy with patriotic fervor in the attempt to meet the great and growing demand for war material. Very satisfactory wages are paid to both women and men, and the consequence is that many women and girls recently employed by storekeepers are now working in the production of munitions of war.

Some time ago one of the most noticeable things about Barrow was the great dearth of employment for females. Now the reverse is the case, and many storekeepers are compelled to work the best

they can with too small a staff. This is all the more difficult to do, because with Barrow so crowded with people as it is at present, there is the greatest activity among storekeepers, who are having the time of their lives.

The town is dead set on being of the greatest service to the Government in connection with the supply of war material.

## UNIVERSITY STUDENTS AS SHELL MAKERS.

THERE is a growing feeling amongst men of all grades and positions in Sheffield that, where business will possibly permit it, and army requirements cannot be satisfied, their services may be offered at the armament works. What is wanted, says a correspondent of The Engineer, is someone to organize this phase of patriotism so as to turn it to practical account. If the Government would invite them to enlist in an industrial battalion, with a definite promise on the part of employers that the old positions would be reserved for them after the war, I believe it would prove a very popular move, and one that would provide a sound reserve of intelligent, enthusiastic laborers ready, for their country's sake, to turn their hands to anything whilst the war lasts.

I have been personally approached by men who expressed a strong wish that something of that kind could be done, and if my mentioning it in this letter will help in advancing the suggestion in the right quarter I should be glad. In some cases men have four or five hours' leisure a day which they would gladly devote to such an object, and other men, as already indicated, would be prepared to drop their ordinary vocations for the time being and become armament workers. Lord Kitchener allows six months for a recruit to be licked into shape, but these men, long before the expiration of that period, would be doing very useful work and would feel that they were helping the country as much as the men in the trenches.

### Organizing Munitions Production.

At a very representative meeting of traders held recently to consider how many more of their employees could be spared for service with the colors, one of the speakers, Lord Wharncliffe, said he had always been against conscription, but he thought we were rapidly approaching a time when that method—not for the army alone, but for works engaged in the production of munitions—would be the only solution of our difficulties.

At the same meeting, the Vice-Chancellor of the University announced that a number of students who were rejected last year by the army because of minor defects, had asked to be permitted to spend the whole of the long vacation in the armament works. He had, he added, ascertained, not only from the heads of the armament firms in Sheffield, but also from the Munitions Committee at the War Office, that the need of men at these works all over the country was so great that they could take all the students he was likely to send them and many more. He suggested that shop assistants who were not fitted for the army might be able to render valuable service in that direction.

## NEATSFOOT OIL BELT TREATMENT

By N. G. Near.

WITH reference to P. W. Blair's article in May 20 issue of Canadian Machinery, I note what he says about Neatsfoot Oil being a good leather preserver.

### COMING CONVENTIONS.

**American Railway Master Mechanics' Association, Atlantic City, N.J.—June 9-11.**

**Railway Supply Manufacturers' Association. Convention and exhibit in conjunction with the Railway Master Mechanics and the Master Car Builders.—June 9-16.**

**Master Car Builders' Association, Atlantic City, N.J.—June 14-16.**

**Associated Advertising Clubs of the World, Chicago.—June 20 to 24.**

**American Society of Mechanical Engineers, Buffalo, N.Y. (Spring Meeting.)—June 22-26.**

**American Society for Testing Materials, Hotel Traymore, Atlantic City, N.J.—June 22-26.**

**American Foundrymen's Association, Atlantic City, N.J.—Sept. 27-Oct. 1.**

**Foundry and Machine Exhibition Co., Atlantic City, N.J.—Sept. 25-Oct. 2.**

Now, I do not want to take direct issue with Mr. Blair because it has been known for years that Neatsfoot Oil has much to recommend it for some treatments of leather, but the benefits show their value rather less in belt service than in other uses to which leather is put. Neatsfoot Oil is not gummy, hence it keeps the leather pliable and prevents drying and cracking, which certainly are valuable qualifications for use on belting.

The disadvantages and limitations, however, are that it is to a certain extent volatile, and contains more fatty acid than good belt treatment does, and because it is a liquid oil it tends to increase stretching and to make the leather too soft for best transmission purposes. It does not give the pliable, mellow density and strength that a real belt treatment with its heavier body gives, nor does it prevent slipping except insofar as a pliable belt slips less than a dry, hard belt. A belt treated with Neatsfoot Oil cannot be run slack under full load with the true advantages of slack running.

I call attention to these facts because I often see Neatsfoot Oil, Castor Oil, Linseed Oil, and almost any other oil recommended for belts in place of regular treatments on the market. I cannot understand why a thing made for a specific purpose should not be best for that purpose, as is usually the case in actual test. Home-made remedies are all right in cases of emergency, but, when the best is wanted, we invariably seek the foremost manufactured product made by manufacturers who have had most experience in their respective lines. It is logical that the manufactured product should be best. I, therefore, recommend Neatsfoot Oil only in cases of emergency, and for regular service a good manufactured treatment.

## MOTOR TUG FOR HUDSON BAY.

THE Hudson Bay Co. are having built at the Polson Iron Works, Ltd., Toronto, a gasoline engine driven tug for service in Hudson Bay and other northern waters. The hull is specially designed to suit the particular service for which the tug will be used. It is constructed with steel framing over which is laid wooden planking. Another feature is the turtle deck made of steel plate over the forward section, while amidships above the deck is a steel plate deck-house for protection against the weather.

The principal dimensions are as follows: Length over all, 36 feet; breadth moulded, 9 ft. 6 in.; depth moulded, 4 ft., and draft, 3 ft. The propelling engine is a "Buffalo" 30 h.p. 2-cylinder gasoline motor. As the tug will frequently be used for lightering purposes, four tow barges are also being built. These barges are of steel frame construction with wooden planking laid over in a similar manner as in the tug. The barges are 48 feet long; 14 feet wide and 4 ft. 11 in. deep. They will be shipped "knocked-down," and re-erected at point of destination.

**The American Locomotive Co.** has placed an order with the Chapman Double Ball Bearing Co., Ltd., Toronto, for 68 elevating transfer trucks for its Richmond, Va., and Dunkirk, N. Y., shops.

## WAR ORDERS AND THE BUSINESS OUTLOOK.

ORDERS for war material are still being placed, but, in many cases, manufacturers are hesitating because of the growing scarcity of trained men. Quite a number who have been employed steadily in Canada for some years are now leaving to accept positions in the United Kingdom. The result is that responsible contractors hesitate to obligate themselves to deliver munitions in given quantities when inducements are offered their men to leave for Britain. This movement, coupled with the prospect of a very great shortage of labor during harvest, adds some uncertainty to the business outlook.

## GIVING PLACE TO WAR MUNITIONS.

EACH succeeding week in the life and record of our time, gives unmistakable point to the fact that business arising from and for the successful prosecution of the war is that on which our Canadian engineering and allied enterprises must in greater degree concentrate. In making this assertion it is by no means inferred that those concerns not yet engaged in the manufacture of shells must needs be forced into it, or that their taking a hand involves even the semblance of sacrifice.

Insistent and positive assertion has, we believe, contrived and contributed to make us feel, if not believe, that our Dominion is "all right," therefore we have concluded to let Providence and the farmer both prove and maintain it so. Industrial enterprise in a multiplicity of capacity has gone into the shell business, patriotically and commercially, and soon, few, if any, of our responsible concerns will have ignored the call or passed-up the opportunity. What surprises us, however, has been the studied indifference displayed in many quarters to this matter of shell manufacture, for only now are many of our engineering and metal-working plant administrations waking up to their privilege and opportunity.

In another section of this issue, reference is made to the organization of female and student labor for munitions of war production in Great Britain. Attention is also directed to the decision to utilize a certain technical school and its student enrolment for the manufacture of shells. Isn't there some scope in Canada for some such development? In Montreal and Toronto, at least, are to be found technical schools whose capacity and equipment are quite equal to the task of producing something up to one hundred shrapnel shells per day, if only those responsible for the administration were alert to the situation.

Wouldn't it be some real worth tribute to what these institutions are designed to accomplish, and wouldn't it seal for all time their educational value, both practical and technical, to have such of our technical schools as those named, and others, inaugurate right now a shell manufacturing enterprise? The benefits derivable would be threefold—the cause would be advanced, our manufacturers would have opened up to them a new source of skilled help supply, and a keener public interest would be evinced in the work and aim of technical and industrial education.

The difficulties to be overcome in taking advantage of such an opportunity as now exists are little, if any, harder than those successfully negotiated by our manufacturing plants, large and small. Besides there would, it appears to us, be little possibility of a shortage in either youthful labor in the day time or manhood labor for a three-hour shift in the evening. There would be just sufficient novelty in the work, esprit de corps or patriotism, present to not only maintain but increase interest, and with the added incentive of fair remuneration, we believe shell manufacture would progress merrily.

Machine tool equipment for the manufacture of shells has been for some considerable time now at a premium as regards delivery, and little if any of the required type is to-day to be found idle. In spite of the advent of summer holidays and the usual school closing accompaniment, shouldn't some cognizance be taken of the stress and requirement of the day, and steps be taken to insure that all machine tools either meantime suitable or easily adaptable to the production of shells be pressed into service? The opportunity to prove the practical worth and utility of our technical and industrial schools has never been so easy of embrace. Their national standing calls for a national response, and their relation to our industrial life calls for a co-operative effort.

# The General Market Conditions and Tendencies

**This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.**

**Montreal, Que., June 7, 1915.**—Market conditions have been extremely quiet throughout the last week in practically all lines except that of metals. The steel interests have been going after business strenuously, and the eloquent appeal made by Britain for more shells has come home. Manufacturers connected with this work are putting forth every effort to increase their production. Spelter and lead have demanded a great deal of attention in the metals section, especially the former.

#### The Steel Market.

Greater activity than ever is being shown by our steel companies to get business, and the demand for shells is being met whole-heartedly by them in the matter of the manufacture of the necessary steel. Some foreign business is meantime being secured, and there is not the slightest doubt that this will be substantially increased in the future.

#### Pig Iron.

The pig iron market keeps flat, there being but few sales reported and no price changes.

#### Machine Tools.

The demand for a greater production of shells maintains in the machine tool market the already unprecedented situation. Manufacturers of tools are sparing no efforts to get increased produc-

tion from their plants. Deliveries are, however, in many cases problematical. Trade in jigs and fixtures suitable for tooling up standard machines so that they can be pressed into this urgent work is very brisk. There is really no solution to the abnormal situation other than to let time work its own remedies. Meanwhile the ingenuity of our mechanical men is being tested to the limit, and we are glad to say they have not been found wanting.

### Metals.

Copper has been very quiet during the week, not many sales having been reported. The price keeps quite firm, however.

Tin has started to go up in price again, and is now 45c. This is due to the short supply in America and the uncertainty of future deliveries.

Spelter is the centre of interest. It has gone up to 30c a pound, which is more or less phenomenal. It is hinted in some quarters that this price has not been established by legitimate supply and demand regulations, and that the market is being manipulated.

Lead has soared again to 7¼c, war demands, it is believed, being behind the rise.

Antimony, though scarce, has not increased in price.

Aluminum has been quiet during the week.

---

**Toronto, Ont., June 8.**—There is little change to note in the general situation, although there are indications of a revival in trade. The opinion is held by many that the depression has already reached its lowest point, and that a gradual improvement in conditions is taking place. The large volume of orders for war materials and supplies has been, and will continue to be, of great assistance towards this end. There is a greater degree of confidence in business circles on account of the encouraging crop prospects, although the financial situation has not as yet become much easier. In the engineering trade there is considerable activity in the shell business and the output is increasing rapidly.

There are a number of price changes to note this week, the principal being in galvanized sheets and pipe, due in both cases to the extraordinary high price of spelter. In the metal market, lead and spelter are higher, while aluminum has declined. The scrap metal market is stronger. Copper, brass, lead and zinc have all advanced. Quotations on iron and steel bars are firm, but unchanged.

### Steel Market.

Normal business continues dull, but the requirement for shells is making greater demands than ever on the output of Canadian mills. So great is this demand that a number of inquiries for rounds have been sent to American mills for delivery in Canada. The Steel Company of Canada is devoting its bar mills exclusively to rolling rounds for shells, and other mills are also increasing production to meet the demands for shell bars and forgings. The Algoma Steel Co. rail mills are fully employed, and it is announced that the Dominion Steel Corporation is operating up to 90 per cent. of their capacity, the greater part of the business being for export. The Nova Scotia Steel Co. is also extremely busy on shell business.

Conditions in the galvanized sheet trade are serious in consequence of the shortage and high price of spelter. As was anticipated, another advance has been registered, and sheets are now 25c per cwt. higher. Although present figures are abnormal, there are no indications of any relief for the present as far as the spelter market is concerned. Efforts, however, are being made to find a substitute for spelter for coating sheets, which, if successful, will tend to bring about more normal conditions. The spelter situation is also responsible for higher prices for galvanized pipe, representing an advance of about 12 per cent. The new basing discounts are now in effect, and are given in the selected market quotations, as are also prices of galvanized sheets.

### CANADIAN GOVERNMENT PURCHASING COMMISSION.

**The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George Gault, Winnipeg; Henry Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.**

### Pig Iron.

The market is featureless and demand continues light. Foundries are operating at considerably reduced capacity.

### Scrap Metals.

The scrap metal market is moving in sympathy with pig metals, and prices of all copper, brass, lead and zinc scrap have advanced on good demand. Scrap copper is 1c per pound higher; No. 1 machine composition, 2c; composition turnings, ½c; brass scrap, 2c; lead, ½c; while scrap zinc has reached the abnormal figure of 17c per pound. Iron and steel scrap are unchanged and the market dull. Prices of scrap will be found in the selected market quotations.

### Machine Tools.

Considerable activity is reported in the machine tool trade, although it is practically impossible to get anything like prompt delivery on new tools. This situation has caused a good demand for second-hand drills and engine lathes tooled up for making shells. Turret lathes and automatics are also in good demand, but difficulty is being experienced in getting tools when they are wanted. An increasing number of inquiries are being sent out for machine tools for high explosive shells, and it is expected that large orders for this type of shell will be distributed. Ordinary business is quiet, the activity being entirely confined to shell equipments.

### Supplies.

Business continues good in consequence of the shell business. A brisk demand is reported for chucks, tool steel, belting, waste, etc. Prices are firm, but unchanged.

### Metals.

The general situation in the metal market is unchanged. The demand for metals for munitions is steadily on the increase, and ordinary business is showing some improvement. The spelter situation is getting worse, this metal being practically unobtainable. Copper and lead are very strong, the latter having advanced; but tin, although firmer, is unchanged. Antimony is firm, but unchanged, and aluminum is weaker.

**Tin.**—The London market has advanced, but New York is firm and active. The tin situation is improving, and there is every indication of higher prices. Locally quotations are firm, but unchanged, at 40c per pound.

**Copper.** — The copper position is strong, and the market has an upward tendency. Consumption continues heavy, and is expected to increase as the demand for munitions become greater. Prices will no doubt go higher. Local quotations are firm, but unchanged at 21c per pound.

**Spelter.**—The situation is showing no signs of improvement. There is not much business, as the limited supply will not permit of any great activity. Locally this metal is practically unobtainable, and quotations are purely nominal. A 5c advance is recorded, the quotation now being 30c per pound.

**Lead.**—Lead has advanced another $2 per ton in New York, and the market is very strong and active. Good business is reported at the advancing prices and the activity has been greater than at any time during the past eight weeks. Locally, lead has advanced 1c, and is quoted at 6¾c per pound.

**Antimony.**—The market is firmer and more active on account of good buying, there being a growing demand for anti-

mony for munitions, and all available supplies are being reserved for this purpose. There is a shortage of this metal in the local market, and the indications point to higher figures. Local quotations are nominal at 40c per pound.

**Aluminum.**—The market is easier and prices have declined 2c, quotations being nominal at 24c per pound.

## STEEL WORKS AT NEWCASTLE. N. S. W.

OF more than passing interest to the administrations of Canadian steel products plants is the following statement from the columns of the "Weekly Bulletin," Department of Trade and Commerce, Ottawa, relative to the establishment of a steel works of considerable magnitude at Newcastle, New South Wales, Australia:

After an expenditure of about $5,000,000, the company recently commenced operations, the blast furnace being now at work and the rest of the plant is rapidly approaching completion. Contracts have already been taken for the supply of large quantities of steel rails for the Transcontinental Railway and for the various State Railway Systems throughout the Commonwealth. The company has started operations at a singularly opportune time when oversea competition is minimized by the excessive freight rates now ruling. In no branch of production is it more imperative that a country should be independent of outside supplies than in iron and steel, and in the matter of large contracts for the railways and other public utilities, the company is bound to receive a preference in accordance with the established precedent of the country. When the works are completed, the plant will, in addition to steel rails, produce structural steel, angle iron bars, sheets, fencing wire and allied goods.

In South Australia, the company owns a most valuable mountain of iron stone of exceptional quality which is conveyed by steamer, some 1,100 miles, to the extensive plant erected beside the finest coal mines in the Southern Hemisphere.

## CANADA'S DEBT INCREASES.

THE financial statement recently issued shows that the Dominion's net debt at the beginning of June was $432,317,630.55, as against $313,558,250.15 at the corresponding period last year; an increase of $118,759,380.40 during the year. Included in this total is war expenditures loaned by Great Britain. In the two months of the fiscal year there has been an increase of $24,195,415.74 in the net debt because of this.

On May 31st outstanding temporary loans totalled $87,733,333, as against $8,273,333. Long term bonds will not be issued against these loans at the close of the war.

Revenue for the first two months of the fiscal year was $21,759,296.18 as against $21,572,161.41 for the corresponding month.

Consolidated expenditure for general expenses amounted to $5,780,212 as compared with $5,504,555 for the same period of 1914; an increase of over $200,000. Capital expenditure for works of a permanent character was $2,371,205 compared with $1,838,750, an increase of half a million.

The total increase is therefore about $700,000. In addition to war outlays there are heavy expenditures on public works, including railways and canals.

### ALLIES PURCHASING AGENTS.

**The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:—**

**International Purchasing Commission, India House, Kingsway, London, Eng.**

**British.—Col. A. G. Barton and F. W. Stobart, Ritz Carlton Hotel, Montreal.**

**French.—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendance Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminister, London.**

**Russian.—Messrs. S. Ruperti and Aieksieff, care Military Attache, Russian Embassy, Washington, D.C.**

## FEDERAL REVENUE IS BACK TO NORMAL.

THE month of May is the first month in which full returns of the Canadian war taxation measures are available. The Dominion's total revenue for the month from Customs, excise and war tax was $9,102,565.16. In May last year the revenue totalled $9,107,165.42.

Analysis of the May returns shows customs, $7,012,082.43; excise, $1,782,518.62, compared with $7,430,264.64 and $1,676,900.78, respectively, in May, 1914.

For the first two months of the current fiscal year the total revenue is $21,759,296.18, as against $21,572,161.41 in the corresponding period last year. In these two months, special taxation was derived as follows: Banks, $248,500.78; loan and trust companies, $54,786.90; insurance companies, $76,412.62, and inland revenue war tax, $88,016.27. Railway tax returns are not due until July 15.

## MONTREAL CUSTOMS RECEIPTS.

FOR the month of May, 1915, the Customs receipts at the Montreal Custom House came within $157,173.02 of equaling the receipts for the same month in 1914. If it had not been for the scarcity of tonnage, which has made it difficult for Canadian merchants to get goods from Great Britain, the receipts for last month would probably have exceeded those of May last year. If the same number of regular liners had been coming to the port as there were last year, it is estimated that they would have been able to carry considerable cargoes, owing to stocks being low in the country.

The total receipts for May were $1,854,980.45, as against $2,012,153.47 in May of last year. For April, the receipts were $1,580,738.38, as against $1,571,255.19. Up to the end of May the receipts in 1915 have been $8,342,419.23, made up as follows:—January, $1,541,064.56; February, $1,680,107.41; March, $1,685,528.43; April, $1,580,738.38; and May, $1,854,980.45.

## GOVERNMENT WORKS WILL BE CONTINUED.

IN connection with the request of the delegation of Canadian Mayors that measures be taken by the Dominion Government to relieve unemployment, it is announced that the Government will continue the construction of all public works under contract in Canada. The total expenditure of the Dominion for the year, apart from the war, will reach $200,000,000, while the war expenditure will make $100,000,000 additional. The Federal Government is, therefore, raising about $1,000,000 per day, exclusive of Sundays, to maintain its existing programme and carry on the war.

In addition to outlays in other departments, the Government programme for the current year includes expenditure upon public works of over $25,000,000, on railways and canals of $27,000,000, on capital account alone and on works of Harbor Commissioners of over $3,500,000.

Since the outbreak of the war, the Dominion has used every effort not only to prosecute the war, but to minimize unemployment in Canada by maintaining its programme of public works, including the I.C.R. terminals at Halifax, Welland Canals, Quebec Bridge, N.T.R. and Hudson Bay Railroads, terminal elevators and harbors at Halifax, St. John, Quebec, Montreal, Toronto, Hamilton, Port Arthur and Fort William, Vancouver and Victoria.

### TONNAGE DECREASES AT CANADIAN PORTS.

THE scarcity of ocean tonnage continues to constitute the chief obstacle to the carrying on of the external commerce of the Dominion. A statement has been prepared here officially showing to what extent the tonnage has declined chiefly as a result of the withdrawal of so many ships for Admiralty purposes, as well as from other causes arising from the war. This statement deals with the condition on both oceans and applies to all the principal ocean ports of the Dominion. The figures are for April, and in each case the register tonnage is given. For Victoria, B.C., the figures are 152,373, as compared with 196,987; Vancouver 140,600, against 212,920; Montreal 2,734, against 35,958; Quebec nil, against 40,232; St. John 131,853, against 108,983; and Halifax 125,000, against 223,052. It will be seen that in every port with the single exception of St. John, there is a substantial decrease in the tonnage for the month of April. The St. Lawrence figures are partly governed by navigation conditions.

### COAL PRODUCTION IN CANADA.

SALES, shipments, colliery and other mine consumption and coking productions of coal in Canada for 1914 amounted to 13,594,984 short tons, valued at $33,433,108, compared with 15,012,178 tons, valued at $37,334,940 in 1913. This was a decrease of 1,417,194 tons, or 9.4 per cent. in quantity and of $3,901,832, or 10.4 per cent. in value.

Arbitrary values are assigned to coals of Nova Scotia and of British Columbia. These are rated as $2.50 per long ton for Nova Scotia and $3.50 per long ton for British Columbia. In the other provinces prices are those returned by the operators. Distribution of production is as follows:

| | Tons. | Decreases. | Value. |
|---|---|---|---|
| N. S. .. | 7,338,790 | 641,283 | $16,381,228 |
| Alta. ... | 3,667,816 | 346,939 | 9,367,602 |
| B. C. .. | 2,238,339 | 476,081 | 6,994,810 |
| Sask. .. | 232,541 | x19,644 | 375,438 |
| N.B. ... | 104,055 | x33,744 | 260,270 |
| Yukon . | 13,433 | 6,279 | 53,760 |

x—Increase.

**Ottawa, Ont.**—Announcement of the suspension of the big works at Courtenay Bay is confirmed by the Public Works Department, the contract of the Norton Griffiths Co. having been cancelled. It is stated that the works, entailing an expenditure of about $7,000,000, were to have been completed in two years, but at the rate of progress it appears likely to take 10 years. The company was notified to speed up, and it failed to do so. The works will not be abandoned, but it has not been decided whether the Government will complete it or call new tenders.

# CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Comissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

## CANADIAN TRADE COMMISSIONERS.

**Argentine Republic.**

H. R. Poussette, 278 Balcarce, Buenos Aires. Cable Address, Canadian.

**Australasia.**

D. H. Ross, Stock Exchange Building, Melbourne, Cable address, Canadian.

**British West Indies.**

E. H. S. Flood, Bridgetown, Barbadoes, agent also for the Bermudas and British Guiana. Cable address, Canadian.

**China.**

J. W. Ross, 6 Kiukiang Road, Shanghai. Cable Address Cancoma.

**Cuba.**

Acting Trade Commissioner, Lonja del Comercio, Apartado 1290, Havana. Cable address, Cantracom.

**France.**

Phillipe Roy, Commissioner General, 17 and 19 Boulevard des Capucines, Paris. Cable address, Stadacona

**Japan.**

G. B. Johnson, P.O. Box 109, Yokohama. Cable Address, Canadian.

**Holland.**

J. T. Lithgow, Zuidblaak, 26, Rotterdam. Cable address, Watermill.

**Newfoundland.**

W. B. Nicholson, Bank of Montreal Building, Water Street, St. John's. Cable address, Canadian.

**New Zealand.**

W. A. Beddoe, Union Buildings, Customs Street, Auckland. Cable address, Canadian.

**South Africa.**

W. J. Egan, Norwich Union Buildings, Cape Town. Cable address, Cantracom.

**United Kingdom.**

E. de B. Arnaud, Sun Building, Clare Street, Bristol. Cable address, Canadian.

J. E. Ray, Central House, Birmingham. Cable address, Canadian.

Acting Trade Commissioner, North British Building East Parade, Leeds. Cable address, Canadian.

F. A. C. Bickerdike, Canada Chambers, 36 Spring Gardens, Manchester. Cable address, Cantracom.

Fred. Dane, 87 Union Street, Glasgow, Scotland. Cable address, Cantracom.

Harrison Watson, 73 Basinghall Street, London, E.C., England. Cable address, Sleighing, London.

## CANADIAN COMMERCIAL AGENTS.

**British West Indies.**

Edgar Tripp, Port of Spain, Trinidad. Cable address, Canadian.

R. H. Curry, Nassau, Bahamas.

**Colombia.**

A. E. Beckwith, c-o Tracey Hmos, Medellin, Colombia. Cables to Marmato, Colombia. Cable address, Canadian.

**Norway and Denmark.**

C. E. Sontum, Grubbeged No. 4, Christiana, Norway. Cable address, Sontums.

**South Africa.**

D. M. McKibbin, Parker, Wood & Co., Buildings, P.O. Box 559, Johannesburg.

E. J. Wilkinson, Durban, 41 St. Andrew's Buildings, Durban, Natal.

## CANADIAN HIGH COMMISSIONER'S OFFICE.

**United Kingdom.**

W. L. Griffith, Secretary, 17 Victoria Street, London, S.W., England.

# INDUSTRIAL AND CONSTRUCTION NEWS

**Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.**

## Engineering

**Milton, Ont.**—P. L. Robertson Co.'s factory is being equipped for making shells.

**Sarnia, Ont.**—The Imperial Oil Co. is building high pressure stills for the making of gasoline.

**Calgary, Alta.**—The Buckeye Machine Co. is installing the necessary machinery for making shells.

**St. Thomas, Ont.**—The St. Thomas Steel Vault Co. factory will be equipped for making shells.

**Woodstock, Ont.**—The George H. King Co. will install the necessary equipment for making shell parts.

**Milton, Ont.**—The P. L. Robertson Co. is installing machinery to make shells for the British Government.

**Windsor, Ont.**—The Swedish Crucible Steel Co. are making extensions to their plant, and will install a new cupola.

**Hull, Que.**—The new equipment at the Hull waterworks will include a turbine pump of 1,200 horse-power and an electric generator of 600 kilowatts.

**Quebec, Que.**—The Eastern Canada Steel Co. are equipping a plant at St. Malo for making shells. An order for 70,000 has been received.

**Vancouver, B.C.**—The large order for shells to be distributed by the Vancouver Engineering Works will be for lyddite and not shrapnel shells, as originally announced.

**Lindsay, Ont.**—The F. R. Wilford Co. have made arrangements to take over the Sylvester factory and will install the necessary machinery for making 18-pounder high explosive shells.

**Demand for Shell Steel.**—It is reported from Cleveland, Ohio, that inquiries are coming in from the Canadian market for prices and deliveries on large rounds to be used for the making of shrapnel for the French Government. Canadian mills are unable to meet the demands of the British and the French Governments.

**The Algoma Steel Co.**, Sault Ste. Marie, Ont., which has already secured important rail orders from American railroads, in competition with the big steel mills on the other side of the line, is reported to be after further business of this character and to have bid for the big order to be placed by the Pennsylvania System.

**Toronto, Ont.**—The erection of a complete modern plant for the reduction of by-products of their mines is contemplated by the Crow's Nest Pass Coal Co. Elias Rogers, the president, has been in England securing plans and specifications from the Simon-Carves Co., Ltd., of Manchester, the great Anglo-French builders of by-product coke ovens, for an up-to-date plant for the Crow's Nest property. The by-products which will be turned out will be sulphate of ammonia, ammonical liquor, benzol and tar.

### EQUIPMENT FOR AUSTRALIAN RAILWAYS.

**Tender forms, specifications, etc., have been forwarded by D. H. Ross, Trade Commissioner at Melbourne, for equipment required by the Victorian Railway. These tender forms are open to the inspection of interested Canadian manufacturers at the Department of Trade and Commerce, Ottawa (refer File No. 1435), and particulars of the requirements, together with the date on which the tenders close at Melbourne, are briefly outlined thus:**

**No. 28,764—July 28.—One vertical milling and profiling machine and accessories.**

**No. 28,765.—July 28.—One plain milling machine and accessories.**

**No. 28,869.—July 28.—One universal testing machine and accessories.**

**The departure of mails in time for the above tenders is as follows:**

**From San Francisco—June 23; due Melbourne, July 21.**

**From San Francisco—July 6; due Melbourne, July 27.**

## Electrical

**Dorchester, Ont.**—A hydro-electric money by-law passed on May 20, by a large majority.

**Edmonton, Alta.**—The Provincial Government of Alberta will install a 125-k.w., direct-current generator at the new penitentiary, Ft. Saskatchewan.

**St. Thomas, Ont.**—Extensions to the ornamental lighting system are under consideration.

**Sarnia, Ont.**—The City Council are in favor of improvements to the street lighting system.

**Kingston, Ont.**—It is proposed to install new electric lights on Barriefield Road at a cost of $721.

**Hamilton, Ont.**—The Hydro Board is considering the matter of raising $240,000 by debentures to carry on new construction work.

## Municipal

**Huntsville, Ont.**—The by-law to authorize waterworks extensions was carried on May 31.

**Victoria, B.C.**—It is proposed to install a number of sanitary drinking fountains in the down-town sections of the city.

**Salmon Arm, B.C.**—The council contemplates an expenditure of $60,000 on waterworks and street lighting extensions.

**Hull, Que.**—Extensions to the water distribution system to cost $100,000 are contemplated. The by-law has been passed.

**Newmarket, Ont.**—The town will sell the steam power plant consisting of two Corliss engines and generators, switchboard, etc.

**Toronto, Ont.**—Improvements to the Morley avenue sewage disposal plant are contemplated. An "Imhoff" tank may be installed.

**Paris, Ont.**—The ratepayers will vote on a by-law on June 7 to guarantee a bond issue of $10,000 to C. E. Wheelet & Son, needle manufacturers.

**Hespeler, Ont.**—A well is being drilled for increasing the water supply. Tenders will be called shortly for the construction of a reservoir, a standpipe and hydrants. Kitchen & Johnstone are the engineers.

**Petrolia, Ont.**—At a meeting of the council, the Fire, Water and Light Committee gave notice that they would introduce a by-law for raising $35,000 for constructing a new plant for hydro power or for buying and reconstruction of the present plant.

**Ottawa, Ont.**—The tender of Heap & Partners, Ltd., Montreal, for booster pumps has been provisionally accepted by the city. The company's tender was the lowest, and amounted to $5,100.

**Welland, Ont.**—A test section of the gigantic water pipe which is to bring fresh water from Lake Erie to Welland, Thorold, Merriton and St Catharines, is soon to be constructed. This section will be about 200 feet long and 5 feet in diameter and will form part of the main pipe.

**Toronto, Ont.**—Should the several municipalities interested endorse the scheme prepared by Chief Engineer McLean for the construction of an improved highway between Toronto and Oshawa, a commission will be created in the near future to carry out the project. The cost of the work is estimated at $237,000, plus $127,905 for grading, cutting down inclines, drainage, culverts and the construction of new bridges.

## General Industrial

**Sandwich, Ont.**—The Canadian Salt Co. will make an etxension to their plant to cost about $15,000.

**New Westminster, B.C.**—The Liverpool Canning Co. will build a salmon cannery here to cost about $10,000.

**St. John, N.B.**—Fire on May 27 in the shipping department of the Atlantic Sugar Refineries caused considerable damage.

**Sherbrooke, Que.**—The Page Printing & Binding Co. will establish a paper box factory here. A section of the Page Building will be used for the purpose.

**Walkerville, Ont.**—Hartwell Bros. will build a factory here for making implement handles. The Williamson Construction Co. are the contractors.

**Hamilton, Ont.**—Davis Bros. are erecting a modern clothing factory. The building will have an 80-ft. frontage and will be three stories high.

**Toronto, Ont.**—The American Fire Extinguisher Co. will erect a new factory, 50 by 100 feet, at the corner of Weston road and Westport avenue.

**Toronto, Ont.**—Fire totally destroyed the premises of the Canada Film Co. and the Indestructible Brick Co. at Swansea, near here, on May 31, doing damage estimated at $115,000.

**Preston, Ont.** — The Hurlbut Shoe Co. propose to erect a factory here to cost $25,000, including machinery. The company are asking for a loan of $25,000, repayable in 15 years. A by-law will be voted on.

**Owen Sound, Ont.**—The Northern Bolt & Screw Co. has received an order from British wholesalers for nails and wire, which will keep them running day and night for a long period.

**Collingwood, Ont.**—The Bryan Manufacturing Co. will probably rebuild their factory on modern lines at an estimated cost of $75,000. The town will be asked to loan $30,000, repayable in 20 years.

**London, Ont.**—Fire originating in some cotton waste on June 6 gutted the factory of the Thomson Knitting Co., 77 Dundas street, doing damage to the extent of $50,000. The loss is fully covered by insurance.

**London, Ont.** — The Wright Lithographing Co. of this city, have purchased the plant of the Laidlaw Lithographing Co., of Hamilton, which they are moving here. The building of the Wright Co. will be enlarged.

**Perth, Ont.** — John E. Playfair's cheese box factory at Fallbrooke was destroyed by fire on May 27 with all the contents excepting the engine, boiler and veneering machine. The loss on the building is $1,500, and on the shafting, belting and machinery $2,000, with no insurance.

**Fort William, Ont.** — Construction work on the three elevator additions in the city, the Ogilvie flour mill elevator annex, the addition to the Western Terminal elevator and the annex to the Dwyer elevator on Island Number Two, is progressing rapidly, and it is expected that all three additions will be completed by the fall.

**Chatham, Ont.**—The Dominion Sugar Co. of Wallaceburg will erect a factory here, but before they do so, they demand a guarantee of railway connection with the G. T. R., for which it is necessary to cross the C. P. R. Arrangements are under way, and a by-law granting a free site will likely be offered to the ratepayers soon.

## Tenders

**Hespeler, Ont.**—Tenders are being called for pumping machinery and a steel water tank. Full information may be obtained from Bowman & Connor, engineers, Berlin, Ont.

**Ottawa, Ont.**—Tenders will be received up to July 1, 1915, for the manufacture, supply and erection of a 30-ton steam wharf crane, of the derricking jib type, for Halifax, N.S., dockyard. The specifications and conditions of contract may be seen at the office of the consulting naval engineer, Ottawa.

**Stratford, Ont.**—Tenders for a 500,000 Imperial gallon elevated water tower will be received until Friday, June 25, 1915. Copies of the specifications and form of tender, can be obtained from F. A. Gaby, Chief Engineer, Hydro-Electric Power Commission of Ontario.

**Quebec, Que.**—Tenders for storage dam at La Loutre on the St. Maurice River, will be received at the office of the Quebec Streams Commission, Room 264, Parliament Building, Quebec, until Tuesday, June 15, 1915. Plans and specifications can be seen at the said office, or at the Quebec Streams Commission's office, Room 803, McGill Building, Montreal.

**Montreal, Que.**—Tenders for constructing the exterior electrical system for the filtration plant of the city of Montreal, P.Q., will be received at the office of the Board of Commissioners at Montreal, P.Q., until June 15, 1915. The plans and specifications are on file in the office of the chief engineer of Public Works of Montreal, from whom copies may be obtained. A deposit of $10 will be required.

**Fredericton, N.B.** — The Provincial Public Works Department has issued a new call for tenders for construction of the substructure of the proposed new bridge over the Petitcodiac River at Moncton. Tenders, which are to close on June 16, are invited under the same plans and specifications as before, and contractors will submit figures for both open dredging and pneumatic caisson methods of performing work.

**Hamilton, Ont.**—Tenders will be received by Chairman of Board of Control, up to Wednesday, June 16, 1915, for the following: One 10-ton travelling crane, with all appurtenances for the hand operation of same, complete with block and tackle and the necessary transverse and longitudinal girders and supports. Specifications covering the above may be obtained on application to the City Engineer's office, city Hall, Hamilton.

**Toronto, Ont.**—Tenders will be received up to Tuesday, June 15, 1915, as follows: (a)—For the concrete masonry substructure and concrete floor of the Strachan Avenue Bridge over the C. P. R. tracks: (b)—For the supply and erection of steel superstructure of the above-mentioned bridge. Tenders must be addressed to the Chairman Board of Control, City Hall. Specifications and forms of tender may be obtained upon application at Room No. 311, Department of Works, City Hall.

## NO SCREW CUTTING TOOL CAN BE SUCCESSFULLY OPERATED

**Without Proper Grinding or Sharpening.**

# THE GEOMETRIC CHASER OR DIE GRINDER

is a machine carefully designed and constructed for the correct grinding of thread chasers and dies.

Its use is economy where threading tools are employed.

It not only keeps all the chasers of a set in condition for perfect work, but at the same time prevents excessive wear on one or two of the chasers.

THE GEOMETRIC grinds any make of thread chaser, whether of a stock or special type. Also fitted with a second grinding wheel for ordinary tool grinding.

# Contracts Awarded

**Toronto, Ont.**—The Board of Control has awarded the contract for a sludge pump to the John Inglis Co., Toronto, at $6,490.

**Toronto, Ont.**—The contract for the piling on the Don incinerator has been awarded to John Russell, and it will cost about $7,000.

**Winnipeg, Man.**—The Board of Control have purchased a five-million-gallon pump from the American Well Works, Ltd., Aurora, Ill.

**Stratford, Ont.**—Brennan & Hollingworth, of Hamilton, Ont., have been awarded the contract for concrete piping for the new $72,000 sewer.

**Quebec, Que.**—The contract for the erection of the new C. P. R. Union Station at the Palais has been awarded to the Downing & Cook Co. Work will begin at once.

**Toronto, Ont.**—The Provincial Hydro Commission has awarded the contract for the plumbing and electrical work in the new University avenue building to Keith & Co.

**Hamilton, Ont.**—The Board of Control have awarded a contract for an electric motor to the Canadian Westinghouse Co., Ltd., at $3,325, and for a pump to Canadian Allis-Chalmers, Ltd., at $1,365.

**Moose Jaw, Sask.**—The Roberts Filter Mfg. Co., Darby, Pa., has been awarded the contract for two filters, with a capacity of 25,000 gallons each per hour, to be installed at Snowdy Springs. The price is $4,633.15.

**Vancouver, B.C.**—It is announced that the firm of Marsh, Hutton and Powers, contractors, of Port Arthur, Ont., have secured a $400,000 contract in British Columbia. The work is for the main channel jetty on the Fraser river at Richmond, and will employ a large force of men.

**St. John's, Nfld.** — The contract for the erection of Cochrane Methodist Church has been let to the Downing-Cook Co., of Montreal, their tender —$80,000—being the lowest of nine received. The contractors agree to have the buildings ready for occupancy within eight months from June 1. The Downing-Cook Co. will do the work at actual cost price, plus commission.

# Building Notes

**Quebec, Que.**—An extension to the Foundling Hospital here, to cost $50,000, will be built. Edmond Belanger is the contractor.

**Toronto, Ont.**—J. F. Hartz has taken out a permit for a warehouse and showroom at 24-26 Hayter street, to cost $35,000.

**St. John's, Nfld.**— The contract for erecting the Commercial Cable Co's. new office has been awarded to W. J. Ellis. Estimated cost, $80,000.

**Regina, Sask.**—The contract figure for the new one-storey building which is being erected by T. Bernard for Nay & James on Hamilton street is $8,500.

**Toronto, Ont.**—Ground has been broken for the new School Administration Building on College street, beside the old Technical School. H. N. Dancy & Sons are the masonry contractors.

**Guelph, Ont.**—It is proposed to build a new residence building at the Ontario Agricultural College, and also complete the Physics building. $80,000 has been appropriated for the work this year.

**Toronto, Ont.**—The Drug Trading Co. has received a building permit from the City Architect's Department for the erection of a four-storey brick and mill construction warehouse costing $20,000, at 10 Ontario street.

**London, Ont.**—At a meeting of the Board of Education held recently, the contract for the new North End School was awarded to John Hayman & Sons, at $57,100, and for the West London School to L. H. Martyn, at $5,100.

**Tavistock, Ont.**—The ratepayers on May 27 carried a by-law empowering the Council to take over the public library and convert it into a free library, with a view to obtaining a grant of $7,500 from the Carnegie Library Corporation for a new building.

**Toronto, Ont.**—Tenders for the Jesse Ketchum school, to the total amount of $140,000, will be submitted by the property committee to the Board of Education for approval. The property committee will also ask the board for authority to add a new wing to the Riverdale Public School. The wing will contain four class rooms.

# Trade Gossip

**The Gananoque Electric Light Co.** has had its powers extended and capital increased from $40,000 to $100,000.

**St. John's, Nfld.**—Peter Mars has gone north to look after the shipping to England of several cargoes of pit props.

**The Canadian Ice Machine Co.**, Toronto, Ont., has sold a 100-ton "York" vertical motor-driven ammonia compressor plant to the J. Hungerford Smith Co., Toronto.

**The Chapman Double Ball Bearing Co.**, Toronto, have received an order for line-shaft ball bearings from the Bethlehem Steel Co., South Bethlehem, Pa.

**John Watson & Son, of Montreal, Ltd.**, have been awarded the contract for the ornamental iron at the Ross Pavilion, Royal Victoria Hospital, Montreal. This is, we understand, the largest contract for ornamental iron that has been let this year.

**The Canadian Ice Machine Co.**, Toronto, has installed a 100-ton "York" horizontal motor-driven compressor at the Chatham Packing Co. plant, Chatham, Ont., and a 20-ton steam-driven vertical machine at the Robert Simpson Co. plant, Toronto.

**Ottawa, Ont.**—A plant for the manufacture of large quantities of trinitrotoluol, one of the highest explosives known to modern science, has been erected in Canada and is now in operation. It is reported that plants to make large quantities of guncotton will also be in operation shortly.

**St. John's, Nfld.**—It is reported that, on account of so many of its inhabitants having joined the colors and due to the depression in trade, which has been so manifest of late years, the island of St. Pierre, a French colony off the west coast of Newfoundland, will after war, be annexed to the latter territory.

**Shell Order Speculation.** — Certain firms which accepted shell orders as a speculation and afterwards sublet their whole contracts to other firms, have, we understand, now been brought to book and have been notified that their orders would be cancelled if they were sought to be filled under such conditions. The Shell Committee does not intend to allow second and third profits where it can avoid them.

**Iroquois Falls, Ont.**—It is fully expected that before the end of June the Abitibi Pulp and Paper Co. will commence operations. The first unit will give the company an approximate output of 60 tons daily and this is to be followed by the installation of three additional units later in the year. The entire paper mill will be running, it is expected, before the end of 1915, when an output of over 200 tons daily will be realized.

**Ottawa, Ont.** — Alex. Johnston, Deputy Minister, and Col. Anderson, chief engineer of the Department of Marine and Fisheries, have returned from a trip of inspection to the Pacific Coast. They say that while trade is quiet at present, the development of ports and the construction of railways now in progress in British Columbia is preparing the way for larger business which is expected to develop after the war. The

# Go to Chicago With Your Ad Man

**Attend with him the big Convention of Associated Advertising Clubs of the World, June 20 to 24, 1915.**

You will assimilate more knowledge of modern methods of Advertising, Selling, Distribution, and Management during these five days than could be obtained in a life-time of book study.

You will be brought in touch with the men who have done and are now doing the big things of business. You will participate in the biggest business meeting the world has ever known. You will listen to the expressed thoughts of distinguished Americans concerning present day and future business movements.

You will enjoy Chicago's wonderful park system, boat rides on Lake Michigan, modern hotels, theatres, and other amusements, including the big street pageant, and the Gridiron Show given at the Auditorium Theatre by 150 Chicago Advertising men.

*Distinguished Speakers.* President Wilson, State conditions permitting, will head the notable array of speakers. Hon. William Jennings Bryan, George Horace Lorimer, Arthur Brisbane, John H. Fahey and Henry Watterson are among the others who will be heard.

**Advertisers in and publishers of trade and technical journals will hold special Departmental meetings to discuss their own problems and learn how they can co-operate to better advantage. Other departmental meetings will take up such subjects as catalogues, engraving, printing, mailing lists, sales plans and kindred subjects.**

*The ladies* are wanted too. Special entertainment—teas, luncheons, automobile trips, etc.—is being arranged for them by Mrs. Chas. H. Porter and her committee.

Clear up your desk. Take a five days' vacation in a lake-cooled city. Mix with the business builders. You will return a better business man; a better physical man; and a better thinking man.

**For further information, programme, rates, etc., address Convention Bureau, Advertising Building, Chicago, Ill.**

marine officials state that the G. T. P. dry dock at Prince Rupert, the largest north of San Francisco, which is about completed, will be of material asistance in the development of the Pacific Coast trade.

**Russian Engineers Coming.**—Six eminent Russian engineers, commissioned by their Government to come to the United States and Canada on a trip of inspection of war-time supplies bought for Russia in America, reached New York on June 4, aboard the steamer Bergensfjord from Scandinavian ports. The party consisted of Maximilian Groten, Michael Bronikovsky, Michael Jurin, Nicolai Kemmer, Victor Kofhkin and Arcady Martynoff. They will remain in New York, it is said, for about two weeks. After their work in the United States will have been completed, the party will assume similar labors in Canada. They expect to remain in North America about six months.

**St. John's, Nfld.**—The following items are from the financial report of Finance Minister M. P. Cashin of Newfoundland delivered before the House of Assembly a few days ago, for the fiscal year ending June 30, 1915:—Estimated expenditure, $4,014,970; estimated revenue, $3,300,578; deficit, $714,392. To help offset this deficit a reserve of $198,000, will be brought forward, leaving a net debt of, $516,000. In order to make both ends meet at the end of the fiscal year 1915-16, the Financial Minister proposes to impose a 10 per cent. duty on all articles now on the free list, with a few exceptions, including an export duty of $1.00 per thousand on pit props going out of the country. The total indebtedness of the colony, including a loan of $1,000,000 from the Imperial Government since the beginning of the war, is $32,000,000.

## Railways—Bridges

**Municipality of Swan River, Man.**—A by-law will be voted on to raise $20,000 for building a number of steel bridges.

**Quebec, Que.**—The C. P. R. will proceed with the construction of the new station to cost $1,000,000. The general contract will be awarded at once, but the tenders for the power-house will not be called until later in the year.

**Toronto, Ont.**—Work on the new station at North Toronto, to be jointly occupied by the C. N. and C. P. railways, has commenced. It is said that the new building will cost about $2,000,000. P. Lyall & Sons of Montreal are the contractors.

**Ottawa, Ont.**—It is announced that arrangements are now being made for securing a large amount of rolling stock and other equipment for the National Transcontinental Railway. Hon. Frank Cochrane has asked Hon. W. T. White, Minister of Finance, for a very considerable appropriation.

**Vancouver, B.C.**—Officials of the Pacific & Great Eastern Railway announce that, through the Provincial and Dominion Governments, they have secured about three million dollars, with which to complete the line as far north as the Hundred-mile House in Cariboo, a distance of 223 miles from Vancouver.

**Brantford, Ont.**—The Brantford Street Railway Commissioners have decided to accede to the requests of the Lake Erie and Northern Railway, asking virtually for their right-of-way from Paris to Galt, provided they are fairly recompensed for the improvements they have effected upon the road since they came into possession.

**Berlin, Ont.**—Ex-Mayor W. D. Euler, district vice-president of the Ontario Hydro-Radial Union, has sent out resolutions for endorsation by the municipal councils of the Cities of Berlin and Guelph, and the Townships of Waterloo and Guelph, requesting that the Hydro-Electric Commission make a survey for a proposed Hydro-Radial railway between Berlin and Guelph, via Bridgeport, Bloomingdale and New Germany.

**Montreal, Que.**—The city's estimate of the total cost of elevating the G. T. R. tracks within the city limits is $5,057,745 as compared with the company's estimate of $8,211,000, a reduction of $3,153,255. This information is contained in a report prepared by G. R. MacLeod, engineer of railways, in the civic public works department, and submitted to the Board of Control recently.

## Personal

**Alexander Friddell**, of Montreal, has agreed to accept the duty of financial director of the Canadian shell committee.

**Huntley R. Drummond and James Carruthers**, both well-known residents of Montreal, Que., have each offered $100,000 for the purchase of machine guns.

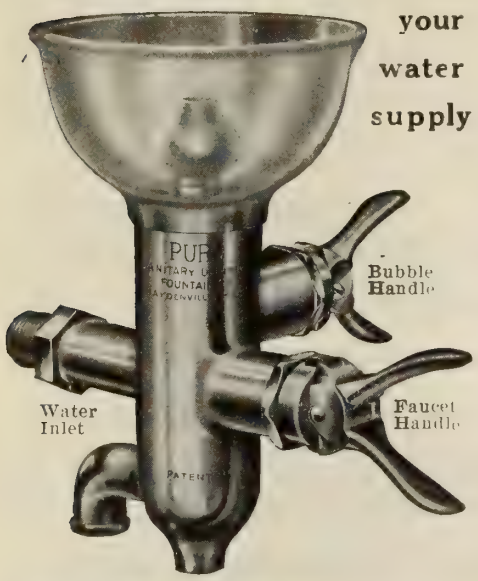
your water supply



THE American Museum of Safety conferred a Gold Medal Award upon the Puro Sanitary Drinking Fountain at the First International Exposition of Safety and Sanitation.
The Puro Sanitary Drinking Fountain won because it deserved to win—Puro had merits that made it stand head and shoulders above any other drinking apparatus.

**Safe Simple**
***Sanitary* Economical**
**Quickly Attached**

These are the qualities that forced the leading safety and sanitary engineers to pick Puro in preference to all others.
No device can be as efficient that does not contain all these qualifications; and Puro was not tied for first place; Puro was first.
Don't be satisfied with half-way goodness, or makeshift drinking arrangements for your employes.
If the men in your factory must drink, give them a clean drink.
Puro is clean—it does not rust or corrode.
Puro is economical. It allows just the proper amount of cool, clean, fresh water to come through the bubbler. No spurting, no overflowing, no loss. Puro regulates itself. You can attach it in five minutes.
Tell us how many men in your factory and your water pressure in pounds—
We'll tell you just what it will cost to "PURO-FY" YOUR WATER SUPPLY.

ner of Archibald & Brotherhood, dealers in engineers' supplies in that city, is reported wounded.

**J. A. Cunningham** of the B. C. Refining Co., Vancouver, has been elected president of the British Columbia Manufacturers' Association to succeed the late Mr. K. J. Morrison, lost on the Lusitania.

**Alex. Milligan,** who for many years sailed several of the big steel grain freighters for the Montreal Transportation Co., died at St. Catharines, Ont., on May 29, aged 57. He retired about six year ago.

**William James Campbell,** president of the Campbell Steel & Ironworks Ltd., of Ottawa, Ont., died on June 2. Mr. Campbell was born at Chatham, England, 65 years ago, but had lived in Ottawa since 1867.

**Capt. Charles E. McGee,** until recently assistant manager of the Moose Jaw Electric Railway, has been killed in action. Capt. McGee was in command of a company of the 60th Rifles and also served in South Africa.

**William H. Ewald,** who for the past five years was superintendent of the Hespeler foundry of the Canadian Machinery Corporation, has been appointed manager of the Canadian Buffalo Sled Works, Mr. Melville, the former manager, having resigned.

**Ottawa, Ont.**—It is reported here that Sir Thomas Shaughnessy's visit to England is being made at the urgent request of Lord Kitchener, who is anxious for him to take charge of the British War Office purchase of munitions of war in Canada and the United States.

**H. G. White** of the firm of Harrison & White of Vancouver, B.C., has been appointed trade commissioner by the B.C. Provincial Government under the auspices of the Vancouver and Victoria Boards of Trade. Mr. White will visit the West Indies and Central America.

**Lieut.-Col. Cantley,** of New Glasgow, N.S., has returned to Canada from the front. Col. Cantley while in Europe was in conference with representatives of the Russian Government and has brought back large orders for cars to be built in Canada for the Russian military service.

**James Wallace,** for many years chief engineer on the Princess Victoria, C.P.R. Pacific Coast steamship, was acting in the capacity of chief engineer aboard the Princess Irene when that vessel was blown up in Sheerness harbor, England, on May 27. In a cable received by Captain Troup from the British Admiralty, it was stated that Mr. Wallace had been in the accident and that the worst was feared. W. W. Rennie, according to a cable received by his father from the Admiralty, is also said to have been lost in the accident. He was formerly third engineer on the Princess Victoria.

## Catalogues

**Lathe Turrets** made by Fay & Scott, Dexter, Me., are dealt with in a bulletin recently issued. The illustrations show some new designs of lathe turets, carriage and bed types, particularly adapted to the manufacture of shrapnel shells. A brief description is given of each style together with tables giving the principal dimensions and other particulars.

**Chucks.**—The Westcott Chuck Co., Oneida, N.Y., are distributing a leaflet describing the Westcott spur geared scroll cutting-off chuck, especially adapted for shrapnel shell work. The essential features of this chuck are described, and a table is included giving the principal dimensions of each size.

**Gasoline Engines.**—The Van Blerck Motor Co., Monroe, Mich., have sent us a copy of bulletin No. 18 together with a complete set of specifications covering the Van Blerck type of gasoline engines for commercial purposes. The bulletin is fully illustrated and features the wide field for these specialties.

**Diesel Engines.**—Bulletin No. 1532 deals with the Allis-Chalmers oil engines of the Diesel type. The bulletin contains a detailed description of this engine covering its construction, the cycle of operations, fuel nozzle governing and other important features. The illustrations show a number of typical specimen indicator cards, exterior and sectional views, the latter showing the general construction of the engine and arrangement of valves. Copies of the bulletin may be obtained from Canadian Allis-Chalmers, Ltd., Toronto, Ont.

**Shapers.**—The Gould & Eberhardt Co., Newark, N.J., have recently published an attractive 32-page catalogue devoted to their high duty shapers and attachments. The opening pages contain a full description of the "High Duty" shaper, covering the construction in detail, with illustrations showing the various parts. The following pages contain illustrations of the various sizes of these shapers, accompanied by specifications of each. The "Invincible" shaper is also fully described and illustrated. The concluding pages deal with electric motor application, a number of illustrated attachments, and a summary covering the various features of advantage incorporated in these products.

## The Garvin Machine Co.

**Manufacturers of**

Milling Machines; Profiling Machines; Cam Cutting Machines; Screw Machines; Monitor Lathes; Die Slotting Machines; Screw Slotters; Tapping Machines; Duplex Horizontal Drills; Gang Drill Presses; Four-Head Right-Angle Drills; Wrenchless Chucks; Spring Coilers; Cutter Grinding Machines; Surface Grinders; Hole Grinders; Hand Lathes and Special Machinery.

**We Want All To Have Our Catalog—Send For It To-day.**

**Spring and Varick Streets, NEW YORK CITY**

# VIKING

**WATERPROOF CEMENT LEATHER BELTS**

**Will Save You Much Money, Time, Trouble and Worry.**

"Viking" Belts are just in their element when in wet places and under adverse conditions.

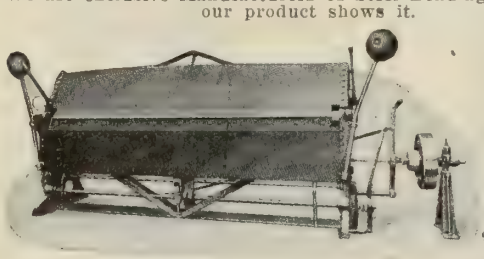
A trial will convince you that they are all-round savers. **Write for particulars.**

**J. C. McLaren Belting Co., Limited**

MONTREAL TORONTO WINNIPEG

## Chicago Steel Bending Brakes

We are exclusive Manufacturers of Steel Bending Brakes, and our product shows it.

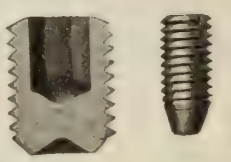


10 ft. for 10 Ga.

Only about three horse-power is required to operate this brake full capacity.

**Catalog giving full description mailed upon request.**

**The Steel Bending Brake Works, Ltd., Chatham, Ontario**



## Allen

## Safety Set Screws

Any length, point or thread. We make a specialty of short lengths.

**ALLEN SOCKET CAP SCREWS**

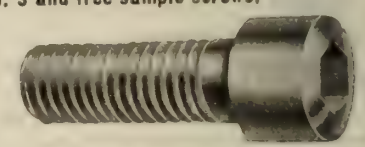
are very neat in appearance and exceedingly strong.

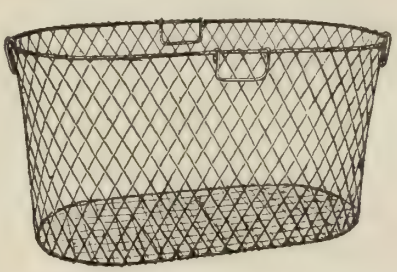
**Send for circular No. 3 and free sample screws.**

**The ALLEN MFG. CO.**

Hartford, Conn.

173 Princess St., Manchester, England





# Dipping Baskets

Our Copper Baskets will withstand **ACID.** Can be made to any shape or size, straining facilities much quicker than sheet metal construction.

## CANADA WIRE & IRON GOODS COMPANY

**Hamilton, Ontario**

**PRESSES—ALL TYPES**

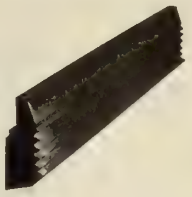
Press Attachments, Automatic.
Metal and Wire Forming Machines.
Tumblers—Large Line.
Burnishing Machines. Grinders.
Special Machines.

**Baird Machine Co., Bridgeport, Conn.**

**20 TIMES THE SERVICE**

That's what this self-hardening, high-speed steel chaser does for the LANDIS DIE.
Four long cutters tangentially disposed to the work carried in suitable holders make an ideal cutting condition. This, along with its many other distinctive characteristics, has established for us a world-wide reputation.
WRITE FOR CATALOGUE NO. 21.

**Landis Machine Co., Waynesboro, Pa.**
Exclusive Canadian Representatives,
Williams & Wilson, Montreal, Canada.



**Detective and Stop Watch Combined.**
"We have a counter on every one of our presses, even the foot presses." This from a satisfied user of our counters. If you use presses our counters would save you money. **Ask for catalog 25.**

**The C. J. ROOT CO., 125 Bridge Street, Bristol, Conn.**

**1/16 Page** $1.60 per insertion on yearly order.

**PULLEYS**

**ALL WOOD—COMBINATION—IRON—STEEL**

Every pulley fully guaranteed.
Write for interesting printed matter.

**The Positive Clutch & Pulley Works, Ltd.**
Montreal Factory: Aurora, Ont. Toronto

**NORTON JACKS**

**For all kinds of heavy lifting**

Send for complete catalogue showing 50 styles 10 to 100 tons capacity.

Made only by

**A. O. NORTON, LIMITED**
Coaticook, Prov. Quebec - - Canada

Gives Satisfaction Where Other Metals Fail

Sold by Leading Dealers Everywhere, or by

**MAGNOLIA METAL CO.**

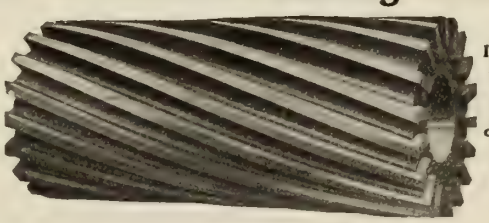
Office and Factory:
225 St. Ambroise St., Montreal

TRADE MARK

THIS SPACE
$3.00 PER ISSUE
On Yearly Order

**Taylor-Newbold Milling Cutters**

Fast Cutting Powerful



Inserted Helical Blades of High-Speed Steel

Will outlive and outcut any other on the market.
4" diameter for general use.

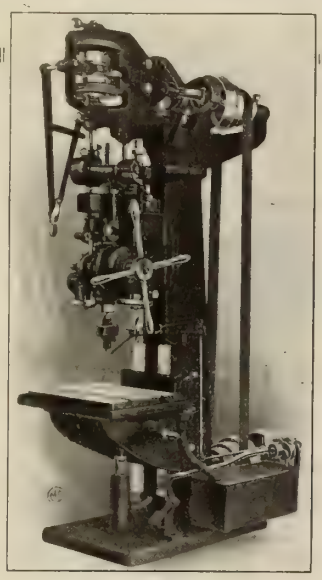
Send for Bulletin R. P. and 30-day trial offer.

**THE TABOR MANUFACTURING COMPANY**
PHILADELPHIA, PA., U.S.A.

## WINNING THE BUYER'S FAVOR

THE best possible buyer is not made an actual buyer at a single step. It is one thing to win the buyer's favor for an article and another to make adjustments incident to closing the sale. Winning the buyer's favor is the work of trade paper advertising. Under ordinary conditions it should not be expected to do more.

# THE TURNER TURRET



Model F.

Affords a very rapid, economical and accurate method for drilling, reaming, counterboring, threading, undercutting, etc., for

**Fuse Timing and Detonator Parts for**

## SHRAPNEL AND LYDDITE SHELLS

**4, 5, 6 operations at one setting.**

Tools revolve. Work set. Turret automatically indexes successive tools to precisely the same working centre. Only working spindle rotates. Trunnion chucks permit operations on several sides at

**ONE CHUCKING, NO STOP FOR CHUCKING, NO SHIFTING OF WORK, NO FATIGUE FROM INDEXING TURRET.**

Less than one second between successive tools.

Turret is suspended within rigid, accurate case, and indexes automatically.

Detent located in case and fits adjustable sockets in turret.

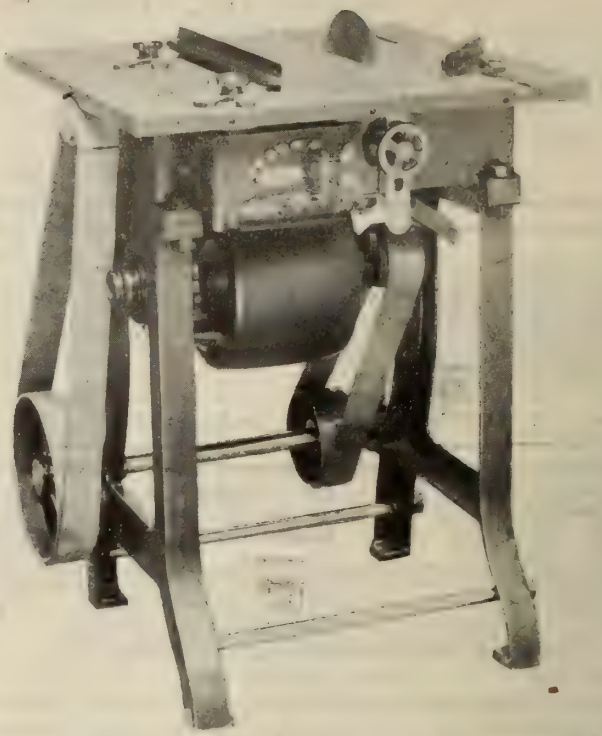
**Very wide range of work. Hand and Power feed.**

SEND US OUR BLUE PRINTS FOR ESTIMATES.

CATALOG ON REQUEST.

**Turner Machine Company**

**DANBURY, CONN., U.S.A.**



# The Acme Metal Saw Table No. 2

**DIRECT CONNECTED**

**USED EXTENSIVELY IN THE SAWING OF**

## SHELL MATERIAL

ALSO FOR CUTTING SHEET BRASS, BRASS AND COPPER TUBES, SHEET COPPER, ETC.

**Built wholly of metal, entirely self-contained. Positively guaranteed.**

One of the best saw tables on the market. It makes a decided "hit" with users everywhere.

**Will take saws up to 10 inches diameter.**

Table swings open and may be set to any depth desired. Slitting gauge may be set from 0 inches to 12 inches wide.

Cross-cut gauge will save from 90 degrees either way to any practical angle.

**Ask us for list of customers and write the user for his opinion.**

Write for full specifications and price.

**The HUB Machine Welding and Contracting Co.**

**22nd and Race St., Philadelphia, Pa.**

# CANADIAN MACHINERY BUYERS' DIRECTORY

TO OUR READERS—Use this directory when seeking to buy any machinery or power equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A rate of $5 per line a year is charged non-advertisers.

**William R. Perrin, Limited**
TORONTO, ONTARIO

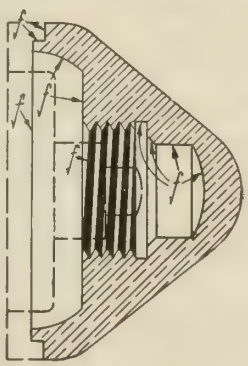
**Cleveland Twist Drills Are Hole Producers**

Tests in some of the largest shops in this country prove conclusively that Cleveland Twist Drills produce the greatest number of holes per money invested in drills.

Read up on Hole Production. Ask for "Drill Chips" to come monthly.

**The Cleveland Twist Drill Co.**
New York CLEVELAND, U. S. A. Chicago

# Automatics for Shrapnel Parts



## 300 Time Fuse Noses Per Hour!

**Labor Cost: 10 cents 100. Material: Aluminum Casting**

This Time Fuse Nose is machined at **one setting** in Size 33 Automatic Five-Spindle Single-Head Chucking Machine. Dotted line indicates outline of rough casting.

**OPERATIONS:** End Faced, Turned, Drilled, Counterbored, Undercut and Tapped.

***Single Head Machines in Four Sizes***

If your product includes small or medium sized parts—whether casting, forging or second operation rod work, and no matter how irregular in shape—the "New Britain" (the only Automatic Multiple Spindle Chucking Machine made) **will save from 60 to 90 per cent. of your labor cost.**

***Double Head Machines in Three Sizes***

# Keep Up The Connection

you have made by past efforts in advertising. New friends are alright, but it is a fallacy for one thing, and bad business for another, to create a demand for goods or service and then lose the fruits of your work by default. Letting your old friends know that you want their business is also the surest way to gain new ones.

Advertising in CANADIAN MACHINERY is the medium.

Rate Cards and full particulars on request.

# Wouldn't An EXTRA Net Profit Look Good Right NOW?

## HERE'S A WAY TO SAVE IT?

Mechanics like to get the "last wear" from a file. That means most of the time they're working with *inefficient* files.

An inefficient file is a time-killer. The time it *wastes* performing a piece of work would more than pay for a couple of *new* files.

By enforcing the shop-rule that no man must use an inefficient file, you save an EXTRA NET PROFIT that's "all velvet" for YOU.

To be sure you get MAXIMUM EFFICIENCY from your files use only the

## "Famous Five"

## KEARNEY & FOOT
## GREAT WESTERN
## AMERICAN
## ARCADE
## GLOBE

***(Made in Canada)***

They are the *finished* product of 50 years' GOOD file-experience. The *net* results of high-grade materials—special machinery—and complete control of every operation from furnace to file. 60,000,000 output yearly assures their *economy*. Searching inspections and strenuous tests guarantee their *efficiency*. "90 per cent. of Canada's file requirements" prove that with men who know — the "Famous Five" are FIRST.

*Give them a trial in YOUR shop. Write for Catalog and "File Filosophy" TO-DAY.*

## Keen Kutter Cutting Compound

a most efficient lubricant for use on lathes, for drilling and cutting, protects the dyes, very cooling, is easily mixed, and the best article on the market for the work.

## Shell Tempering Oil

is an oil prepared by us to meet the special requirements for **tempering shells.** We also manufacture Lard and other cutting oils required for special work, and will be pleased to quote on request. ALL our goods are MADE IN CANADA and guaranteed. Write us to-day if you are in the market.

**The Commercial Oil Company Limited**

**Hamilton, Ontario**

**USE THIS COUPON,** and we will send you our **NEW BOOKLET** and show you what can be done by the

**L'AIR LIQUIDE SOCIETY**
**Maisonneuve—Montreal, P. Q.,**

Send, without obligating me, postpaid, your NEW BOOKLET, which I promise to read.

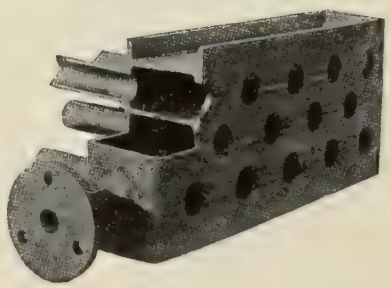
## OXY-ACETYLENE WELDING and CUTTING PROCESS

**No Shop, Foundry, Shipyard, Manufacture, Mill, Mine, Garage should be without it. A Money Saver. A Money Maker.**

**"Made in Canada" Goods.**



**Apparatus made of I-Beams, welded, to stand high pressure.**

## L'AIR LIQUIDE SOCIETY

**(Paid-up Capital $2,200,000.00)**

**26 Boler St. WEST TORONTO** — **Maisonneuve— MONTREAL** — **325 William Ave. WINNIPEG**

**EVERYTHING in the OXY-ACETYLENE LINE**

We manufacture the MOST EFFICIENT OXYGEN,—by Claude's LIQUID AIR PROCESS.

Blau-Gas

## The Safest Gas on the Market For Welding, Cutting and Brazing

The Oxy-Blaugas Welding and Cutting Plant is **safe, simple** and **easy** to operate.

Any **ordinary mechanic** can **learn to operate it** in a very short time.

Of especial value in **repairing machinery** used in **Shell Making.**

Will pay for itself many times over in the course of a year.

The great heat value, **narrow explosive range,** easy transportability and **low cost,** make an Oxy-Blaugas Plant invaluable wherever welding, cutting or brazing is done.

**Welding Broken Gear with Oxy-Blaugas**

**Let us tell you how to save money.**

An inquiry costs you nothing. Write now.

# U. S. Electric Drills and Grinders

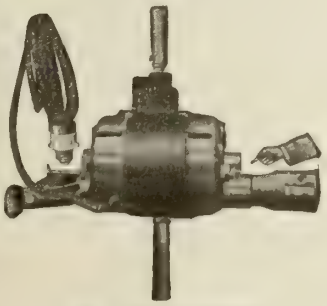
## Save Time, Labor and Money

They can be attached to any lamp socket.

For drilling in metal they are superior to any other kind of portable drill. Cost 50% less to run than air drills.

**3 SIZES.**
**3-16 inch, W.G.T. 6 lbs.**
**¼ inch, W.G.T. 9 lbs.**
**⅜ inch, W.G.T. 12 lbs.**

All motors wound for 110 or 220 volts.
Direct or alternating current.
Try a few of our Electric Drills and Grinders and you'll send us an order for more. Our guarantee protects you.



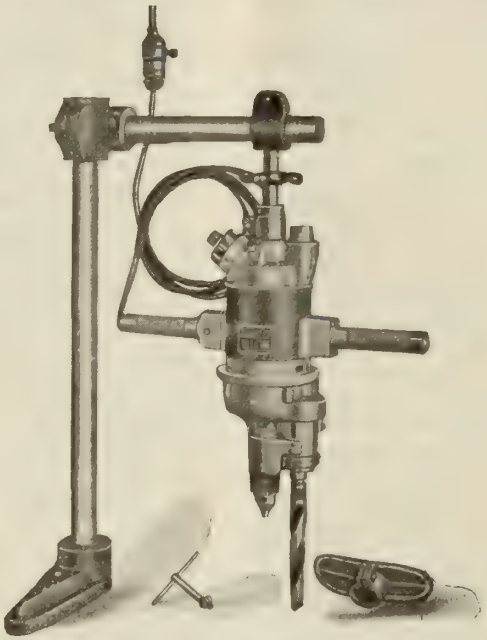
**½ inch—2 SPEED.**
**Speed, 400-750 R.P.M.**

**For Sale By**
**The Canadian Fairbanks-Morse Co., Limited**

**Montreal, St. John, N.B., Toronto, Winnipeg, Calgary, Vancouver.**

**THE UNITED STATES ELECTRICAL TOOL CO.**
**CINCINNATI, OHIO**

# Stow Two Speed Two Spindle Drill



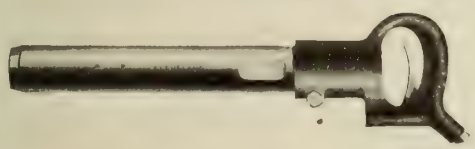
The only tool of its kind on the market. Fills a long-felt want. Will cut your cost.

**We make drills of every size.**

**STOW MFG. CO., Binghamton, N.Y., U.S.A.**
**London, England, Stock: 85 Queen Victoria Street**
Oldest Portable Tool Manufacturers in America.

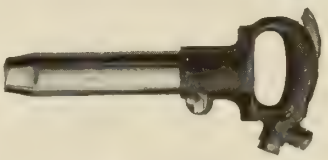
# CLEVELAND RIVETING, CHIPPING, CALKING AND BEADING HAMMERS

## MOST POWERFUL AND EFFICIENT AIR TOOLS ON THE MARKET



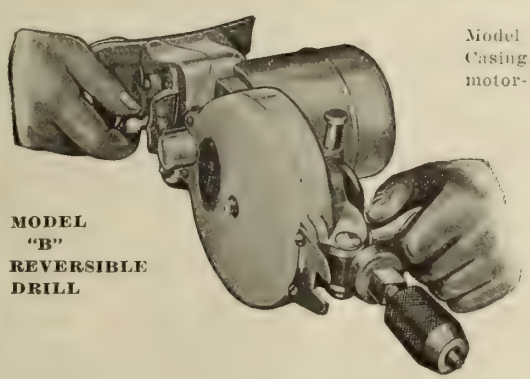
Cleveland Riveters are made in 20 styles and sizes with driving capacities of ¼-in. to 1½-in. rivets in Boilers, Tanks, Stacks, etc.

They have an enviable record for durability and economy in service.



### CLEVELAND CHIPPING HAMMERS

are made in 20 styles and sizes to suit all classes of work. They are ideal tools for foundries, as they have high speed, no recoil and are practically dust proof. In stock:—Riveting and Chipping Hammers, Air Drills, Corner Drills, Sand Rammers, Portable Grinders, Bowes Couplings, Chisels, Rivet Sets, etc.



**MODEL "B" REVERSIBLE DRILL**

### PORTABLE ELECTRIC DRILLS

Model "B" Drill illustrated, shows compactness of design. The Casing, Switch and Gear Covers are aluminum; the breast plate, motor-head and handle supports are of steel. The machine is light in weight, convenient in shape; has high speed; operates on either A.C. or D.C. currents and runs either forward or reverse as desired. Model "C" has two speeds and in construction is similar to Model B.

Bulletins mailed on request.

# No, Stevens' Stopper won't stop a train, but it will stop the blow hole in a defective casting so that you cannot find it.

In this way, it helps your bank account. The casting that otherwise would have to go to the scrap heap can be converted into good coin of the realm.

Same color as the rest of the casting. Doesn't look like a blue patch on Casey's faded overalls.

*How to use Stevens' Stopper, or Circle Cement:*

Stevens' Stopper is a fine powder, used with a little water and made into a paste—the hole is easily filled with a putty knife or trowel. It takes anywhere from two to twenty-four hours, depending upon the size of the patch, for the filler to become as hard as the casting itself. When rubbed with a file it shows the color of the casting, hence it is the best filler and the one thing that saves your castings, and that means the saving of your dollars.

Another thing—I do not ask a fancy price for it.

A pound will save many dollars' worth of castings. Put up in 5-lb., 10-lb., and 25-lb. cans.

FREDERIC B. STEVENS

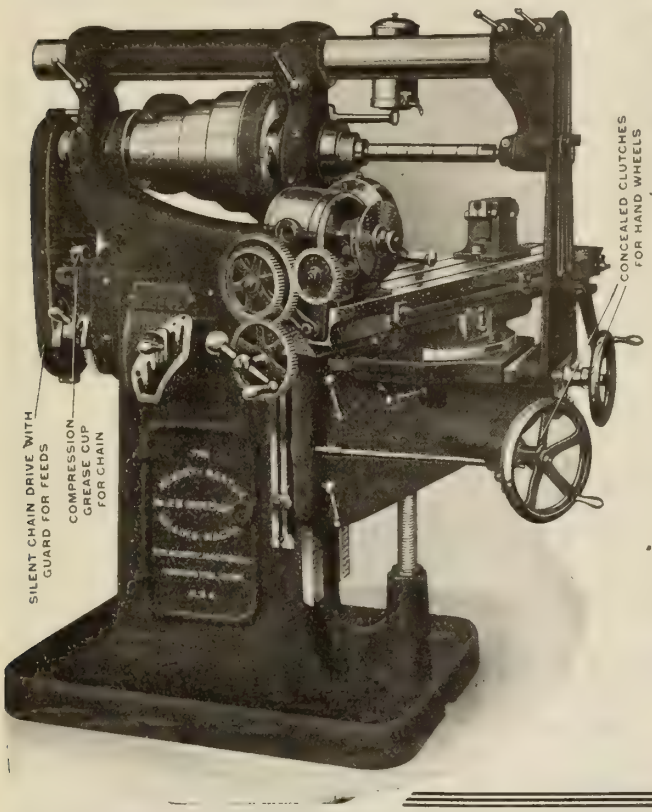
TRADE MARK

# No. 2B UNIVERSAL MILLING MACHINE



## Sets a new high-mark for efficiency and economy

Main Spindle has taper journals which run in annular bearings.

Constant lubrication is assured by ring oilers which revolve with spindle and pump oil from reservoirs underneath bearings.

Thrust is taken on front bearing, and journals have independent adjustment in either bearing.

Feed Shaft is driven from spindle by heavy silent chain pro tected with complete guard, supplied with compression grease cup for lubricating chain and sprockets.

All Feeds positive driven through gearing, giving 18 changes.

Automatic Feeds can be operated simultaneously and reversed while machine is in motion.

Feed Gearing is Hardened and feeds have independent controls.

Vertical and Cross Feed Hand Wheels have concealed clutches in hubs which allow wheels to run free on shaft when not employed.

Dividing Head is cylindrical in pattern. Supporting Block for Spindle is carried by side plates which recess into block and have annular bearings in ring of main frame.

*Little Giant*

## CYLINDRICAL LIMIT GAGES

For shell work this style of gage is most efficient and economical.

**PROMPT SHIPMENT.**

We maintain a large stock at all times.

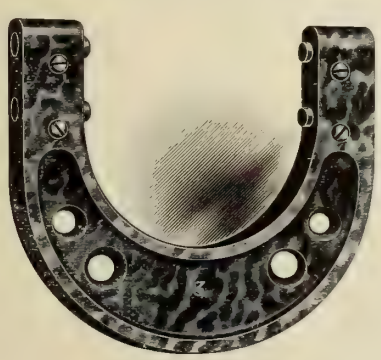
These can be shipped set to special limits specified by the customer within **48 hours** from receipt of order.

Gages set to special limits and with setting plugs can be shipped in 7 to 10 days.

**THREAD LIMIT GAGES.**

For every form and style of screw thread.

Send for our Gage Catalog.



The upper points are set in maximum limits — the lower points to minimum limits. Points can be sealed to prevent tampering.

# Starrett Tools

Every good toolmaker and machinist accepts Starrett Tools as the standard for accuracy because they are always perfectly reliable and are designed for convenience and efficiency.

## Surface Gages

This line includes five styles of surface gages. The most complete type is the Universal Surface Gage No. 257 shown here; sizes 9″, 12″, and 18″ spindles. Prices $3.00 to $4.00.

## Protractors

The protractor shown here is the Universal bevel protractor No. 362 with vernier for use by toolmakers and machinists in measuring and laying out angles. Sizes 7″ to 12″. Prices $8.00 to $11.75, depending on attachments.

## Test Indicator

The segment test indicator No. 64 shown here is useful for testing of work in the lathe, for turning, chucking, or locating on face plate. It may also be used on jig work and other bench jobs in connection with any of our surface gages. Price complete $3.50.

## Send for Catalog

**If you are interested in the purchase of fine tools, send for free copy of catalog No. 203, giving prices of 2100 styles and sizes.**

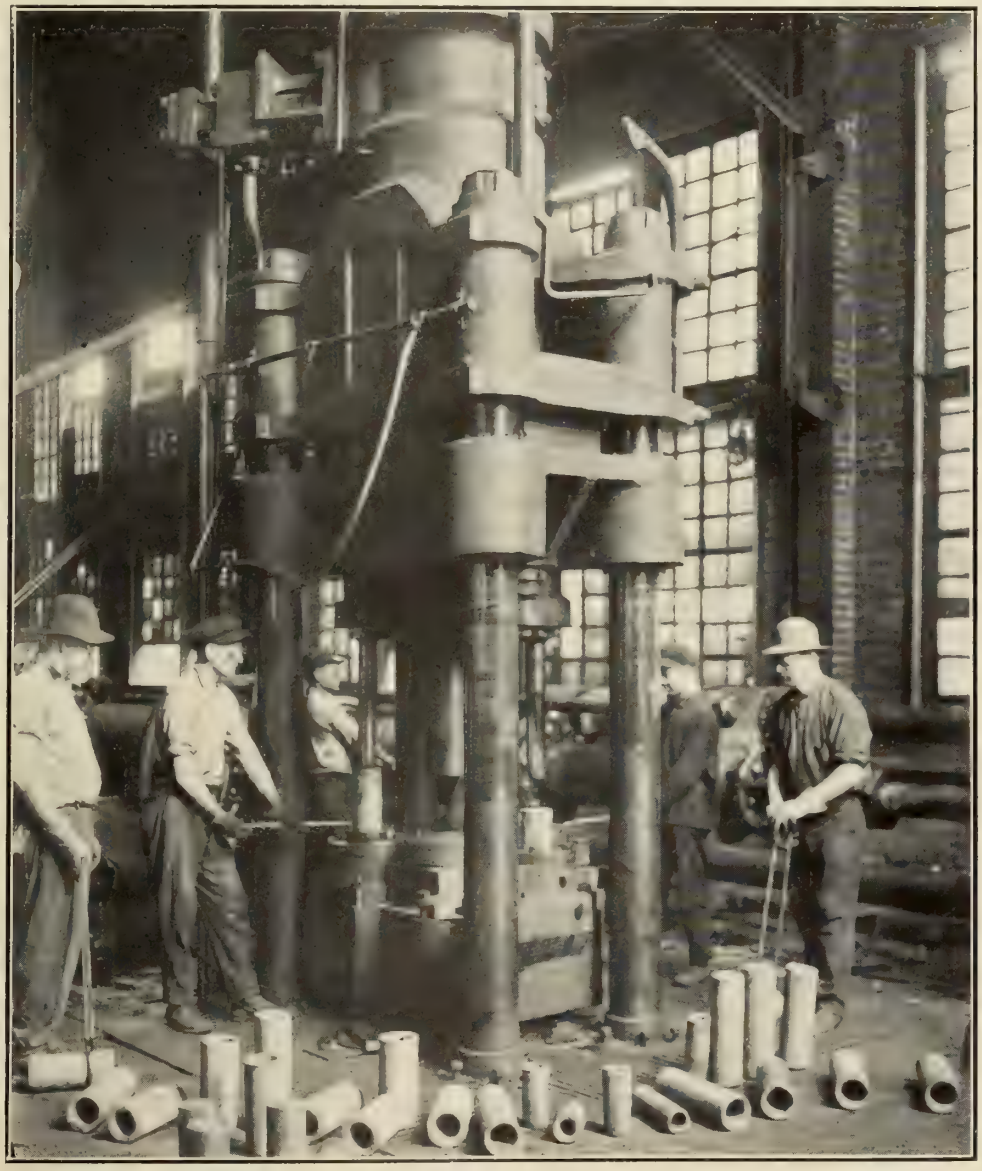
## HYDRAULIC FORGING PRESSES



Purely Hydraulic Tod Presses for Piercing and Drawing of Shells and Projectiles

**The William Tod Co. - Youngstown, Ohio**

We are in a position to supply FORGINGS up to 8" diameter.

# The Tap with the Con-eccentric Land

## For Tapping Nuts

**One-third of the land from the cutting edge is concentric. The remaining two-thirds has eccentric relief.**

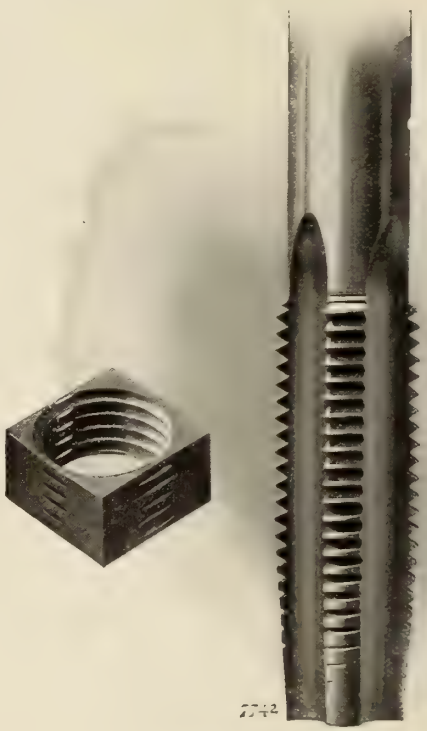
TO show more clearly the free-cutting qualities of these taps, a nut slightly smaller than one and one-quarter inches square was drilled for tapping and held lightly by the corners. The nut was then tapped with a 1¼-7 U.S.S. con-eccentric tap, driven through without reversing. (See cut on right).

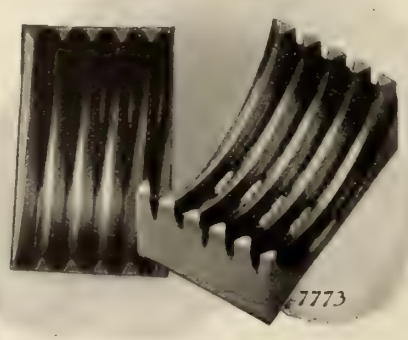
So perfect were the cutting qualities and so easily and freely was the work done that this mere shell of a nut was *not even distorted,* to say nothing of being split as would have happened with a tap differently constructed.

Consider what this means to the nut manufacturer from the standpoint of a *saving in power.* This is but one reason why Pratt & Whitney taps are specified by the largest nut manufacturers in the country.

For a number of years we have made taps with this style of relief. They have won out steadily and consistently on merit alone.

**Write for our Booklet "The Tap with the Con-eccentric Land."**





TAPS can be sharpened at the only correct point — on the face of the cutting edge.

Sharpening in no way affects their size.

Can be sharpened long after other so-called eccentrically-relieved taps are rendered useless.

We obtain the freest cutting tap with the longest life—an exclusive combination.

Accuracy nowhere else obtainable is secured together with a degree of finish and refinement heretofore thought impossible in a commercial tool.

We want tap users to know *why Pratt & Whitney taps are best,* also that our claims are based on reasons mechanically correct.

Cut to left is a tapped nut sawed in half showing small area of metal which held it together.

The taps are carried in stock by our Branch Offices and Agencies throughout the world. Prompt service assured to all customers wherever located.

## A FIRM—A SERVICE—A MEDIUM AND AN APPRECIATION

¶ Buying and selling to-day means a great deal more than the mere signing of an order and the delivery of goods. The transaction involves, or should, to be a complete success, another element—that of SERVICE.

¶ We have much pleasure in reproducing on this page a letter received a few days ago from a firm of machinery dealers whose name needs no introduction to the readers of this journal.

¶ Here is a firm who is as proud of its service as it is of the lines it has for sale. Having successfully advertised that service, it does not hesitate to place on record its appreciation of the medium responsible, in a measure at least, for the success achieved.

**The A. R. Williams Machinery Company, Limited**

*Mr. B. G. Newton, Manager,* *Toronto, June 9th,* 1915.
*Canadian Machinery and Manufacturing News,*
*Toronto, Ont.*

*Dear Mr. Newton:—*

*With reference to the Shell Number of CANADIAN MACHINERY, we feel that some expression of appreciation is due you, owing to the very satisfactory results we have obtained from our advertisement in this issue of your paper.*

*The number of direct enquiries received from this source, is a striking indication of the value of your publication as an advertising medium, and the timeliness of the issue referred to.*

*The results obtained have been very gratifying to us, both as a justification of the high opinion we have always held of your paper as a very profitable advertising medium, and an endorsement of a departure in advertising methods, which is to some extent unique in dealer advertising.*

*We feel that our policy of emphasizing the service we are able to give manufacturers in connection with the selection of equipment of any line of manufacture, is one that will bring us more definite and satisfactory results than any amount of direct advertising of special lines, the ultimate and greater benefit of which must necessarily accrue to the manufacturer of those lines, rather than to us as dealers.*

*On the other hand, by emphasizing the value of our services to the actual, as well as prospective manufacturers, we are able to offer our patrons the accumulated experience of nearly 50 years in solving the problems that arise from time to time, in the inception and growth of any manufacturing industry.*

*Wishing your publication continued success, and thanking you for your co-operation with us in the past, we are,*

*Yours very truly,*
*THE A. R. WILLIAMS MACHINERY COMPANY, LIMITED.*

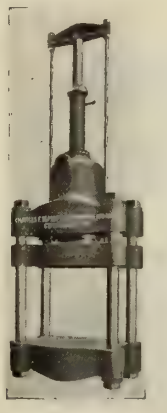
CANADIAN MACHINERY
143 UNIVERSITY AVENUE :: TORONTO, ONTARIO



# ELMES HYDRAULIC PRESSES

Especially adapted for and largely used in the manufacture of **Projectiles, Shrapnel Cases and General Forging Work.**

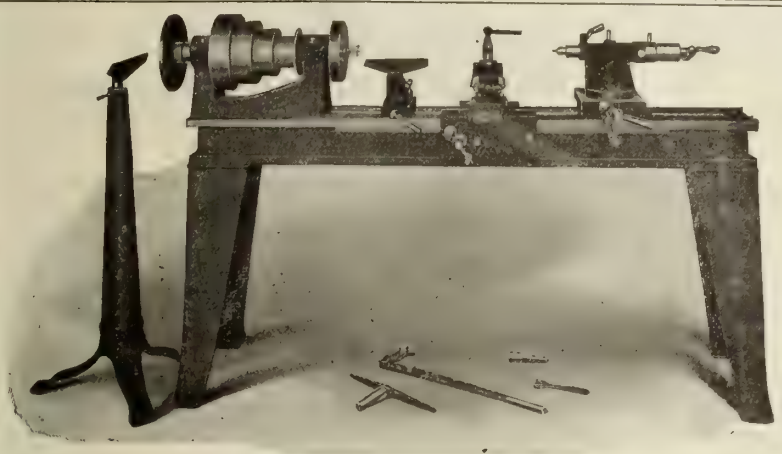
We build stationary and portable presses for die work, bending, forcing and other possible press service. If necessary we will even design a special press for your work.

**Send for our illustrated catalog to-day.**

## Charles F. Elmes Engineering Works

**217 N. Morgan Street, Chicago, U.S.A.**

*Over 50 years' experience building hydraulic machinery.*



## Patternmakers' Lathe

**(16 inch Swing, 6 ft. Bed)**

Equipped with a hand carriage having rack and pinion feed in addition to regular hand rest.

The **Spindle** is of high carbon steel and runs in **self-oiling bronze bearings.** Outer end of spindle is threaded for face plate to turn work of a large diameter.

**Tail** stock has graduated swivel base. The base has set-over slide operated by a ball handle, so that same may be fed crossway of the bed, a feature very desirable for boring or turning.

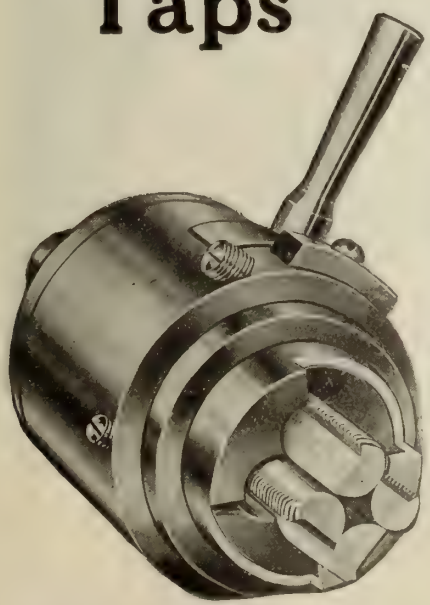
HAS NO EQUAL WHERE EFFICIENCY AND ECONOMY ARE REQUIRED.

May we send full details?

**J. G. BLOUNT COMPANY**

**EVERETT, MASS, U.S.A.**

# M. E. C. Collapsible Taps



## —have broken all records on shrapnel shell work

Used by many Canadian manufacturers of shrapnel shells.

**Would you like to have the users' opinions of M.E.C. Service?**

No doubt you will, for what our taps do for others they are sure to do for you.

**Drop us a line to refer you to some users and to send details re our liberal proposition.**

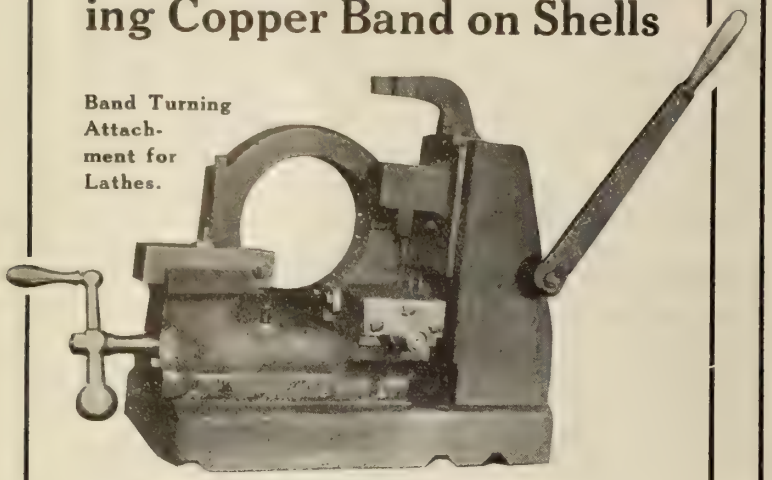
## Manufacturers Equipment Company

**175 North Jefferson Street, CHICAGO**

**Canadian Agents: FOSS & HILL MACHINERY CO., Montreal**
**A. R. WILLIAMS MACHINERY CO., Winnipeg**

## A Time-Saver for Turning Copper Band on Shells

Band Turning Attachment for Lathes.



This attachment will fit any engine lathe, and with its use you can turn the copper band on Shrapnel Shells down to size required and burnish them *all in one operation.*

With this device we will guarantee an output of

**50 Turned Copper Bands per Hour**

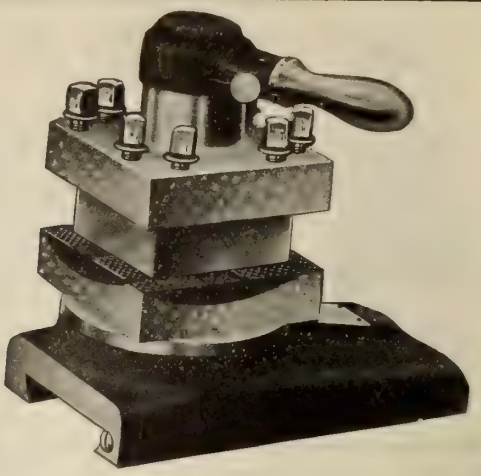
Used with a specially constructed steel chuck, casting of which can be finished on the lathe on which the attachment will be used.

Castings are supplied by us.

*WRITE FOR PARTICULARS.*

**LYMBURNER LIMITED**

**5-15 Commissioners St. Montreal, P. Que.**



## Particularly Adapted to the Manufacture of Shrapnel

**Your Lathe Needs A NEW TOOL POST, One of the Modern Multiple Type.**

You can no longer afford to use the old style single tool holder.

Give us the size of the dovetail on your lathe carriage and height to lathe center; we will quote you price on a Modern Tool Holder that we guarantee will increase your production, and give you some interesting facts about Lathe Turrets.

No matter what make or size of lathe—we can fit it.

**Fay & Scott, Dexter, Me.**

*Little Giant*

## CYLINDRICAL LIMIT GAGES

For shell work this style of gage is most efficient and economical.

**PROMPT SHIPMENT.**

We maintain a large stock at all times.

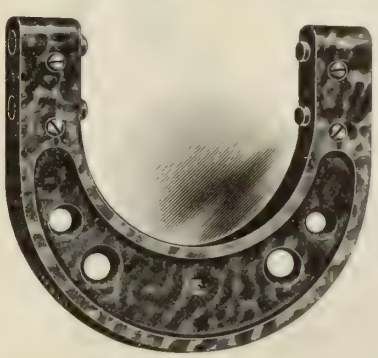
These can be shipped set to special limits specified by the customer within **48 hours** from receipt of order.

Gages set to special limits and with setting plugs can be shipped in 7 to 10 days.

**THREAD LIMIT GAGES.**

For every form and style of screw thread.

Send for our Gage Catalog.



The upper points are set in maximum limits — the lower points to minimum limits. Points can be sealed to prevent tampering.

## Wells Brothers Company of Canada, Limited

**GALT, ONT.**

**Sales Agents:**

The Canadian Fairbanks-Morse Co., Ltd., Montreal, Toronto, Vancouver, Winnipeg, St. John, Calgary.

# Making Cartridge Cases

for rapid-fire guns requires some rather complex drawing operations, together with a larger number of annealing treatments.

If your work includes similar operations—scores of Canadian plants are devoting their attention to making munitions of war.

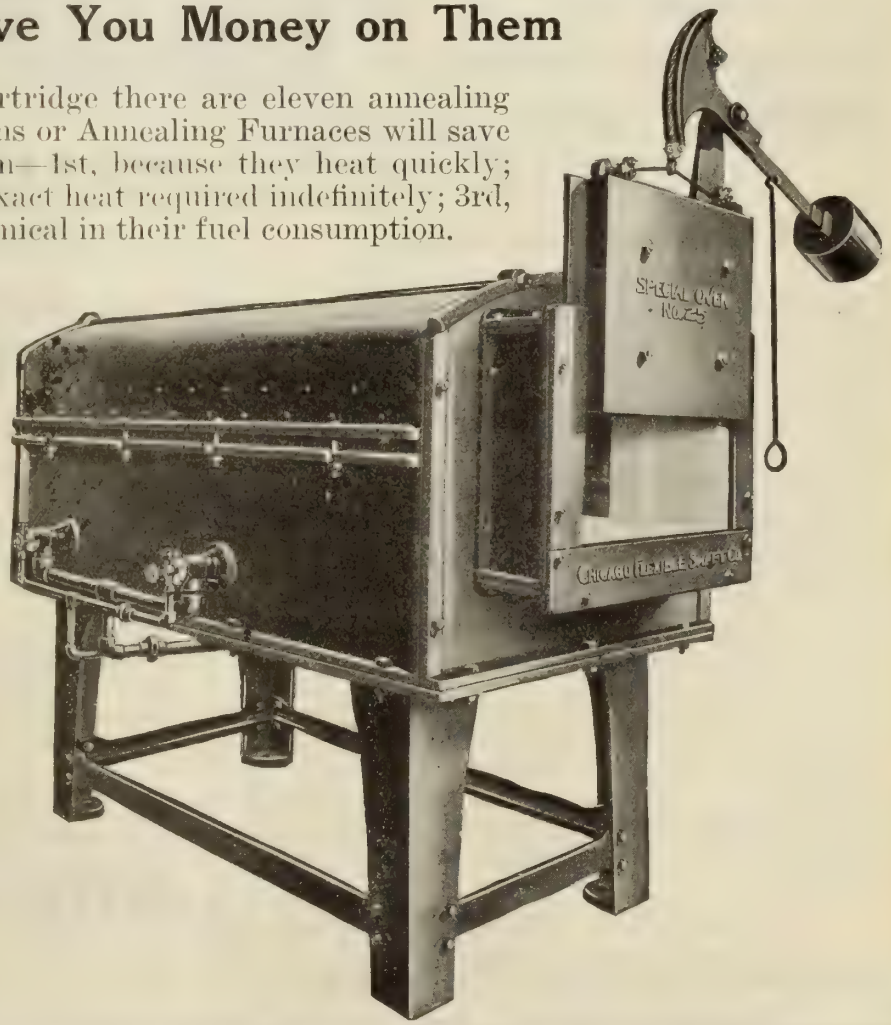
# STEWART GAS and OIL FURNACES

## Will Save You Money on Them

In the making of a 6-in. cartridge there are eleven annealing operations and Stewart Ovens or Annealing Furnaces will save money on every one of them—1st, because they heat quickly; 2nd, because they hold the exact heat required indefinitely; 3rd, because they are very economical in their fuel consumption.

Whatever your requirements we can fill them.

Besides our standard types we are well equipped to design and build furnaces to handle any special requirements in the heat treatment of metals.

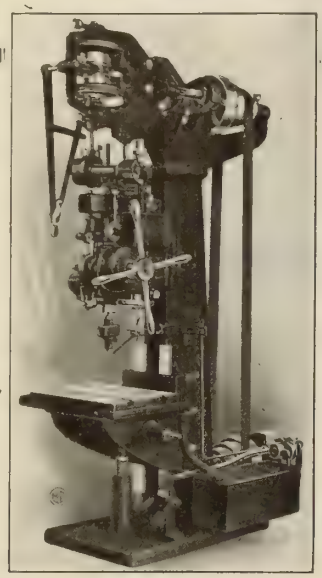


**We Offer**

to prove every statement at our own expense. We will send any Stewart furnace you may select for a thirty days' **FREE** trial. Don't pay a cent unless it lives up to the guarantee. Write for details.

**Chicago Flexible Shaft Company**
**210 to 230 Ontario St., Chicago, Ill.**

# THE TURNER TURRET



Model F.

Affords a very rapid, economical and accurate method for drilling, reaming, counterboring, threading, undercutting, etc., for

**Fuse Timing and Detonator Parts for**

## SHRAPNEL AND LYDDITE SHELLS

**4, 5, 6 operations at one setting.**

Tools revolve. Work set. Turret automatically indexes successive tools to precisely the same working centre. Only working spindle rotates. Trunnion chucks permit operations on several sides at

**ONE CHUCKING, NO STOP FOR CHUCKING, NO SHIFTING OF WORK, NO FATIGUE FROM INDEXING TURRET.**

Less than one second between successive tools.

Turret is suspended within rigid, accurate case, and indexes automatically.

Detent located in case and fits adjustable sockets in turret.

**Very wide range of work. Hand and Power feed.**

SEND US OUR BLUE PRINTS FOR ESTIMATES.

# Williams' "AGRIPPA" Tool Holders

## Are The Proof Of Progress

All our Tool-Holders Positively Guaranteed.

Money Refunded within 90 days if unsatisfactory.

**TURNING-TOOL HOLDERS**

Cam lock.
Rapid and positive.
The greater the pressure, the tighter the lock.
No set-screws to strip or upset.
No holders to scrap.

**CUTTING-OFF & SIDE-TOOL HOLDERS.**

Cam lock.
Rapid and positive.
The greater the pressure, the tighter the lock.
Interchangeable blades.
One holder for both cutting-off and side-tool work.

**BORING-TOOL HOLDERS**

Take multiple bars of all commercial shapes.
No bushings required.

**SLEEVE BAR**

Universal cap for straight or angle cutter.
No loose or extra parts.

**PLAIN BAR**

Simplicity itself—a solid bar.

**THREADING-TOOL HOLDERS**

Combination rigid and spring tool for rough or finishing cuts.
Lockable spring head.
Equally efficient for turning-tool work.
Alloy steel cutters.
Cam lock.

**PLANING-TOOL HOLDERS**

36 angles of adjustment—note serrations in the adjustment ring.
Perfect seating of cutters.
Uniform locking pressure.
Adjustment ring takes the strain, relieving holder of wear.
Excellent also for offset turning-tool work.

# Shell Painting Machine

This machine is a simple contrivance comprising a portable revolving table operated by a motor at its base which receives its current through a lamp socket from the ceiling.

There are six vertical spindles built into the table and the shells are placed on these in an inverted position. These spindles rotate at about 250 R.P.M., and the painting is done with a flat pad from the paint receptacle conveniently attached to the machine. The time required for the painting is—

**Less than One Minute per Shell**

i.e. for the three coats specified by the Government.

The Shells are then lifted from the spindles with a special holder which grips them at the copper band, and are placed in racks to dry.

# Banding Press

**(MADE-IN-CANADA)**

A product of our Toronto Factory, easy of operation and at the same time capable of being adapted to the banding of **18 pr. Shrapnel, 4.5, and Russian Shrapnel and Lyddite Shells.** This machine can operate as fast as any mechanic can feed it.

Let us know what calibre of shell you are making and we shall be glad to quote you for a suitable press.

# Observations on Drop Forging Production Practice*

By A. B. Tilton**

*The subject matter of this paper traces in a racy and general way the present day development of the drop forging industry. Particular prominence is given to the die feature, to the variety of forging material tonnage and the fact that in recent years many lines of forgings have been standardized as regards size and style by different manufacturers.*

HAMMERING or forging hot bars of metal into shape is among the oldest of the crafts. The work for hundreds of years was entirely performed by hand, and, though a marvellous degree of skill was acquired, there appears to have been but slight change in methods; indeed, most of them are still in force where hand work alone is practised.

A departure from the old ways naturally could not occur until the need demanded it and a means for satisfying it appeared. These came during the middle of the last century when the swage of the blacksmith was developed into a form of forging die and the early type of drop hammer was devised. The history of the drop forging industry lies well within this period of about seventy-five years, though by far the greatest improvements both in the machinery and practices have been made during the last twenty-five years.

The making of forging dies is almost as much of an art as it is a trade, and, except for merely elementary features, no fixed rules can be laid down for the work. In the early days of the industry there were but few mechanics, however well skilled otherwise, who could make drop forging dies successfully without a considerable period of actual practice in the work. This condition operated somewhat to retard the development for a number of years.

### The Die Feature.

The making of the dies is a feature of first importance in the production of drop forgings. Each design or piece has to be given individual attention in its construction to promote ease of operation, free motion in the metal while forging, and accuracy in forms and dimensions. To permit the easy removal of the forgings from the dies a draft of seven degrees is usually allowed on the sides or vertical dimensions, although in some shapes this may be more or less than seven degrees. Ordinarily this draft is added, but where the forging is not to be finished to any particular dimension, or if the metal could be spared at that point, it is sometimes taken off. The allowance for shrinking is usually three-sixteenths of an inch to the foot, but practices vary in different shops.

For economical reasons dies are sometimes made with only a single forging impression, which reduces the first cost of the tools to a moderate extent, but the forcing of the hot metal into its final shape without any preliminary operation may sometimes result most unsatisfactorily, since it is liable to create or add to any strains that may have existed in the bar and thereby establish a centre for crystallization when the forgings are in use. By making the dies with at least two impressions, one being merely auxiliary and the other to give a final shape to the piece, the liability of any additional strains is diminished; furthermore the life of the dies is increased.

For the making of plainer pieces one set of dies is usually sufficient, but in many of the more complicated forms, such as crank shafts having three or more throws set at other than straight angles, two or more sets of dies are required, one for each separate operation. Frequently the intermediate operations may be performed in the press, which is normally an auxiliary of the drop hammer, or it may be desirable to resort to first principles and require the assistance of the blacksmith, who is yet, and probably always will be, a very important factor in the working of wrought metals.

The variety of shapes which it is possible to make by this process is almost unlimited, although some would require so many operations as to make the cost prohibitive. Where such are required, however, in large quantities this difficulty may be overcome in a measure, even though three or more operations may be required to produce them. Very thin piece, or those that are thin with heavier sections at intervals, are among the difficult shapes to produce because of the rapid cooling of the thin parts in the dies which prevents the reduction to size without reheating. Such pieces would, therefore, be more expensive than those of equal weight, but more regular in outline and of greater thickness. By far the greater number of shapes in drop forgings are, however, of such thickness and general proportion as to be quite easily handled, and those just mentioned would perhaps be more properly regarded as exceptional.

### Forging Temperature.

As nearly as possible it is desirable to make steel forgings at a uniform temperature, which is about 1,800 degrees, except for tool steel, where it should be much lower at the beginning of the operation, but, as the blows or strokes of the hammer are not ordinarily sufficiently rapid to maintain the heat, the finishing stroke is made at a slightly lower temperature, and, as this temperature varies at the finish, so will the shrinkage in the cooling process of the forging also vary, the allowance for this in the dies being constant. A further variation may be expected occasionally to a smaller extent, though hardly perceptible in the matching of the dies, which, however accurately set in the hammer will vary slightly in the fall, due to the necessary play in the hammer head between the ways. These are almost negligible; however, they should be considered in the construction of jigs for the finishing work. Where uniformity of contour is essential, it is customary to obtain this by re-striking the forgings after the trimming operation in sizing dies, especially on the smaller sizes of forgings. Generally this re-striking operation is done cold, though occasionally at a low heat.

### Drop Forging Tonnage.

The greatest tonnage in drop forgings is in the carbon steels, and principally those below forty points in carbon content. The proportion of tool steel forgings used in the construction of various implements and tools is very slight, but may be properly classed among the carbon steels, though high-speed steels also form a feature of the drop forging product. The growth of the automobile industry has called into use a variety of alloy steels for parts where resistance to vibration is necessary, and forgings made of nickel steel, chrome nickel, and vanadium steel now form a very large part of the product of many drop forging plants. These alloys, besides resisting vibration to a great degree, also furnish when properly heat-treated the remarkable wearing qualities so highly desirable in gears and similar parts. Copper and bronze forgings are also a considerable feature of the drop forging product, though these are restricted chiefly to electrical work and where resistance to corrosion is necessary.

---

*From a paper read at the National Machine Tool Builders' Association Convention, Atlantic City, May 20-21.

**President, Drop Forging Co. of New York.

Within recent years many lines of forgings have been standardized with respect to size and style, so that they may be obtained from manufacturers without the need or expense of special forging dies to produce them. The larger part, however, of the drop forging produce consists of forgings made to customers' individual designs. In most lines of manufacture methods are somewhat uniform, but in the drop forging industry there is much difference in methods, due perhaps to the latitude within which it is possible to work and accomplish the same results.

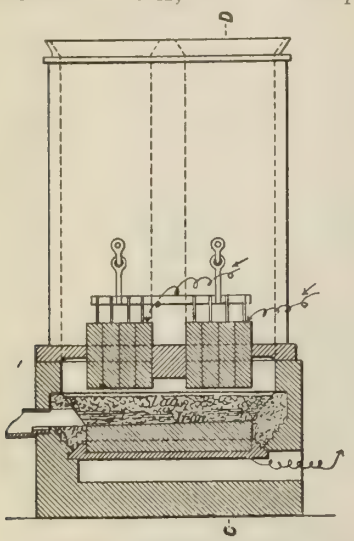

FIG. 1. SECTION AT A.B.

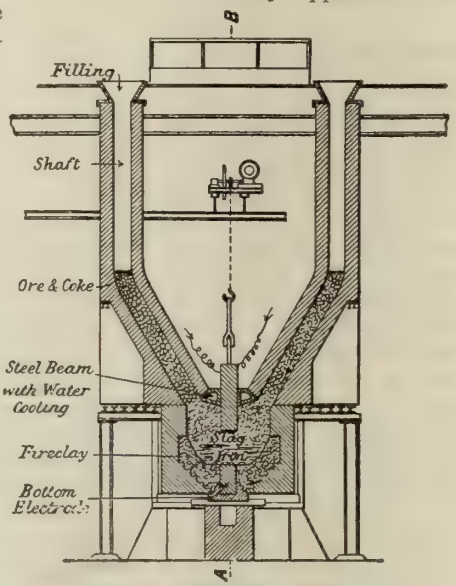

FIG. 2. SECTION AT C.D.

## ELECTRIC IRON ORE SMELTING IN NORWAY.

IN Sweden the adoption of electric furnaces for the reduction of iron ore is apparently spreading, and the results obtained are encouraging and likely to lead to further developments in this direction.

In Norway matters have not progressed quite so smoothly, owing to the different conditions prevailing in the two countries. In Sweden charcoal is used as the means of reduction, but in Norway charcoal becomes too expensive and, unless coke can be used, the process cannot be worked with advantage, in spite of Norway's wealth of water-power. The first attempt with coke at the Hardanger works proved so little encouraging that the whole works eventually stopped, although the ores used were rich in iron.

At Tinfos, however, the very opposite experience has been encountered. A regular and remunerative manufacture of electric iron has now been going on for some time, and the production for the present year is estimated at 10,000 tons of electric pig. This satisfactory result is all the more noteworthy inasmuch as the ores used are rather poor so far as their percentage of iron goes, but otherwise what may be called good ore, hailing from three mines—Klodeberg, Grevinde Wedel, and Fon Anker—averaging some 45 per cent. of magnetic iron ore.

### The Tinfos Electric Furnace.

The illustrations show the Tinfos electric furnace. It differs from the Swedish furnace used at Trollhättan (description of which has already appeared in our columns) by having a shaft on each side, so that the ore is led on to the two square electrodes. The upper electrodes each consist of three or four smaller electrodes that are arranged in combination.

The electric current proceeds from the electrodes through the charge, the slag, and the liquid pig-iron, down to the bottom electrode. This furnace, consequently, differs from the Swedish furnace, not only in having a bottom electrode, but, also it has no gas circulation and requires very little water for cooling purposes. The fourth furnace differs from the three others by having three heavy round electrodes with nipples. The question of a furnace with but one shaft is by no means excluded. The charge consists of iron ore, coke, and according to circumstances, limestone, the quantity of which depends upon the nature and blending of the ore, the quality of the coke, and the quality of pig-iron wanted. Charcoal, as already mentioned, is not used.

A couple of years' patient experimenting in different directions, and not always under the most favorable conditions, have led to the production of pig of high quality, strong, and comparatively tough. Even at an early stage of the experiments it could be ascertained that the iron produced promised exceedingly well, thanks to certain good qualities in the ores used. When coke is used, the shafts of the furnace need not be very high, and, as a rule, the charge does not reach higher than a little beyond the bend in the shaft. The upper part of the shaft serves as a chimney, which produces the necessary draught in the furnace. To fill the shafts any higher with ore than shown in the illustration is not to be recommended when the ore contains zinc.

### Tinfos Electric Pig Iron.

The Tinfos electric pig-iron is close, being produced electrically, without any air being blown into the furnace. This pig can thus with advantage be used for all kinds of foundry goods which require much strength, such as cylinders, presses, pumps, propellers, etc., and it can with advantage be added to ordinary cheap and less strong pig, used in the foundries with or without addition of ferro-silicon.

Tinfos pig, inasmuch as its chemical composition can be altered and regulated, can also profitably be used in Basic Martin steel-smelting, for all electric steel-smelting, or for softened castings. Among the different Tinfos pig-irons are such as contain:

| Si. per cent. | | Mn. per cent. | S. per cent. | P. per cent. |
|---|---|---|---|---|
| 0.3 | with | 0.1 to 1.0 | 0.03 to 0.1 | 0.02 to 0.04 |
| 0.4 to 0.8 | | 0.1 to 1.0 | 0.04 | 0.02 to 0.04 |
| 1.0 to 1.5 | | 0.1 to 1.0 | suspicion to 0.02 | 0.02 to 0.4 |
| 1.0 to 1.5 | | 1.5 to 2.0 | " 0.02 | 0.02 to 0.04 |
| 1.5 to 2.0 | | | | |
| 2.0 to 2.5 | | | | |
| | | 0.1 | " 0.02 | 0.065 |

The cost of production, including ore, coke, limestone and electrodes, besides wages, crushing, weighing and transport of materials, mounting of electrodes, repairs, storage of iron, the laboratory and electric energy, can, according to what so far has been experienced, be kept at from $17.75 to $18.25 per ton of pig-iron (perhaps based on cheaper coke than present quotations) when all three furnaces are kept going, exclusive of management, sinking fund and taxes.

From the beginning of the present year all four furnaces have been worked regularly, one being always kept in reserve. Each furnace produces about 9 tons per day, or 27 tons for the three, making some 10,000 tons per annum. The percentage of pig-iron from the ore varies from 44 to 47 per cent. according to the quality of the latter. The current in the furnace may be as much as 1,200 k.w. to 1,400 k.w.—Engineering.

## Inventive Genius and Research Operate to a Dual End — They Aim to Improve What We Now Possess and Bring to Our Service Commodities Before Unknown

### FORM GRINDING.

By Howard W. Dunbar

THE subject of form-wheel grinding is one which, up to the present time, has been given but little thought or consideration by the user of grinding machines, therefore few realize the possibilities from the forming of the face of the grinding wheel for the purpose of producing accurate, irregular shapes. This lack of consideration and knowledge of the subject is due largely to the fact that to successfully accomplish the operation of grinding, using a formed wheel, it is necessary that a wide face wheel be used, and the operation performed by a "straight in cut," or in other words, a cut without traveling the table.

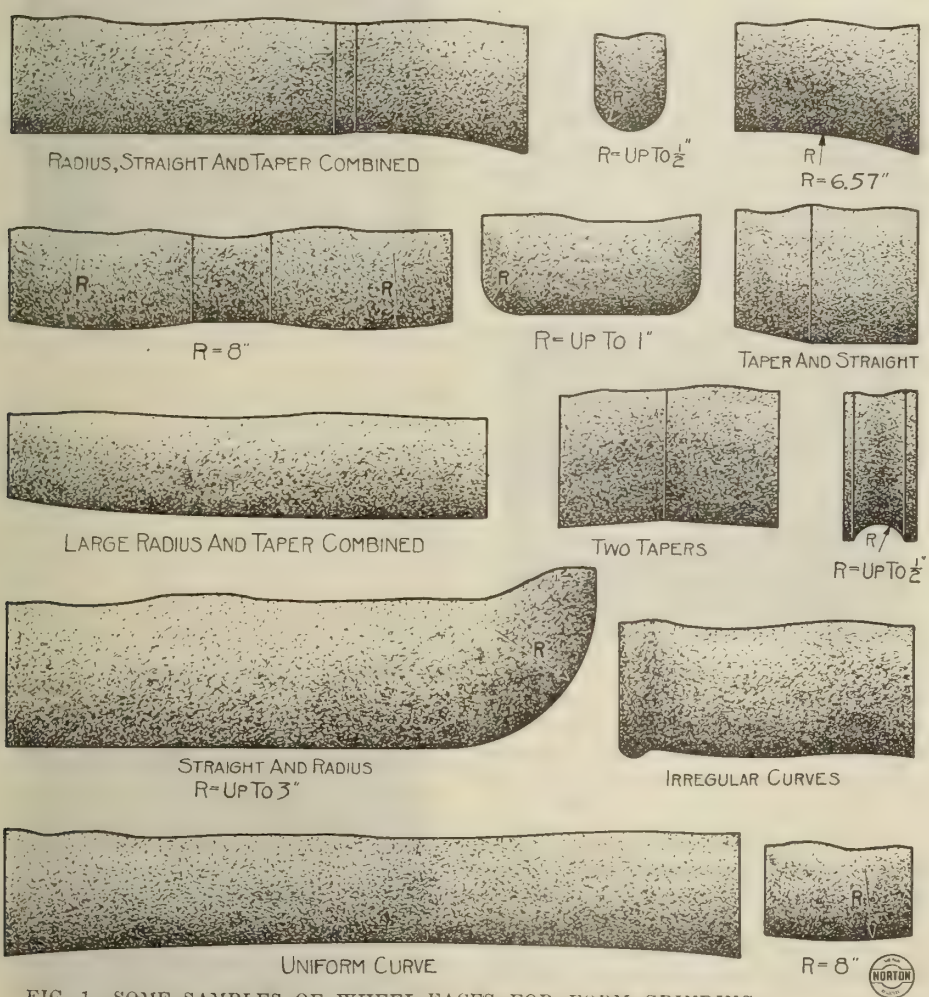

FIG. 1. SOME SAMPLES OF WHEEL FACES FOR FORM GRINDING.

#### Wide Face Wheels

It is within a comparatively few years that the users of grinding machines, and even some of the manufacturers of grinding machines, have accepted the theory of the use of the wide face grinding wheel as advocated and advanced by Charles H. Norton. Tradition has said that it was impossible to get accurate work properly finished and in good time by using a wide face wheel. Up until a short time ago, a wheel 1½ inches wide was considered a wide wheel. Today, however, we have machines which carry wheels up to 12 in. face, which not only make possible the grinding of formed parts but also increase the production and broaden the field of cylindrical or straight grinding.

In the early development of the grinding machine it was only natural that the evolution should come about through the then commonly known method of producing cylindrical work—the lathe. It was reasoned that with a lathe and a traveling tool of a single point, a part could be machined by turning and a cylinder produced. Naturally, in designing the grinding machine, the designer's mind entered about the lathe, and the grinding wheel took the place of and was fashioned after the lathe tool,in that it had a very narrow face. By traveling the work and grinding with this wheel, a cylinder was produced considerably better and more accurate than that produced by the lathe. As time went on a wider and wider wheel came into use. More cutting particles were caused to do their share of the work and with faster table travel greater production was brought about, and equally good cylinders produced.

This has been carried to a point where now pieces of work up to 10 in. long are not traversed, and a wheel 10 in. wide is used to grind them. Longer work than this is traveled as always, but the same advantage can be obtained even though the work is traversed, if wide wheels are used, providing the traverse of the work is practically equal to the width of the wheel for each revolution of the work. The only limit for the width of wheels is the physical possibility of their manufacture, and the expense for machines of suitable power and durability for carrying such wide wheels.

To-day we have multiplied the cutting points that on the average wheel 4 in. wide and 24 in. diameter, 1,086,171,000 cutting points come in contact with the work each minute. Multiply this by using a wider wheel, and it, of course, becomes obvious that the greater number of cutting particles which come in contact with the work in a given time, the greater is the amount of material that can be removed.

#### Grinding Machine Construction

Back of these beliefs, and the principal reason for them, was the grinding machine—it was not properly constructed to carry a wide wheel. Of course, a machine using a wheel face of say 10 in. or 12 in. must be properly constructed to do the work that such a wheel is capable of. In the earlier designs of grinding machines this was not taken into consideration. The machines had been planned for narrow wheels.

Success was not assured with wide face grinding until a machine had been designed with sufficient power and rigidity and so constructed as to stand up under the strain of the work which it was called upon to do. The spindles had to be of the finest kind of material, with ample bearing surfaces and large, well-made boxes of good material.

This brings us to the point of the possibilities in using this wide face wheel with a specialty trued form for the purpose of grinding irregular shapes. It is essential in form grinding that this form be continuous and uniform, that there be no under cuts to grind, as virtually the same laws govern the possibilities, insofar as the shape of the grinding wheel is concerned as govern form milling; the grinding wheel is only a milling cutter having infinitely more teeth. In order to insure that the wheel stands up uniformly, sharp corners should be avoided, and fillets introduced in the corners whenever possible.

### Form Grinding Limitations

The limitations of form grinding are governed entirely by the capacity of the

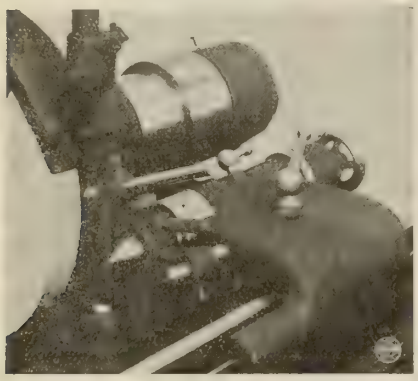

FIG. 2.

attachment used in shaping the wheel, and the observance of the peripheral speed of the wheel at the various points in the form, so that with the proper wheel this variation comes within the possibilities of the "grain and grade" furnished. Deep forms are possible but not practical, as the difference in diameter on the various points in the form produce a different action on the wheel, and naturally a wheel that is

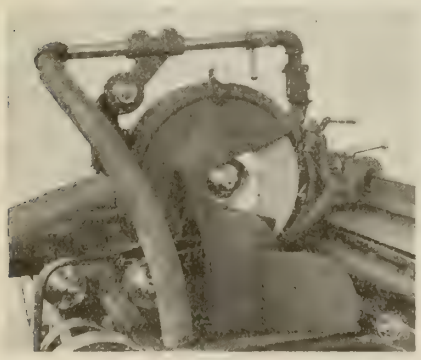

FIG. 3.

satisfactory on deep cuts is not satisfactory on shallow ones.

Of course, it is understood in grinding a form that the wheel cannot be traversed, but must be fed straight into the work. Simple forms, such as putting the fillet in the shoulder of a shaft or the neck of a roll, are accomplished with one corner of the wheel, and the straight part of the cylinder ground

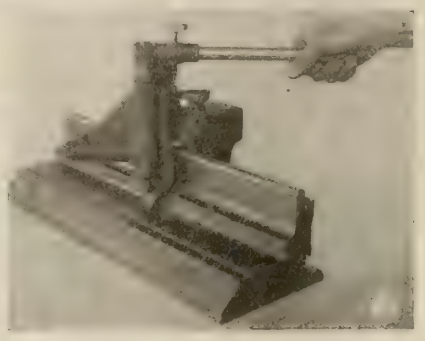

FIG. 4.

with the face of the wheel by traveling the table. As a matter of fact, straight grinding, where the work is not traversed, could be termed "form grinding."

### Wheel Truing

No doubt the question will be asked, "Do you not have to true the wheel often, and isn't it expensive?" We must say that the wheel must be trued and must be trued often to keep its face as near perfect as possible, but the fact that the wheel is wide, and in many cases covering the entire length of the cylinder being ground, it is working upon the entire cylinder at once, while

FIG. 5.

a narrow wheel, dependent upon traverse for producing the cylinder, cannot, of course, be working on but a small part of the cylinder at one time.

Taking the original standard of width, which was $\frac{1}{2}$ in., and assuming a wide wheel of 12 in., we have 24 narrow wheels working at once on the cylinder. Now we have but to consume the same amount of time and expense in truing this wheel of 12 in. face as we would require to true 24 wheels of $\frac{1}{4}$ in. face, and, in return for our labor of truing, we have ground the piece of work in practically one twenty-fourth of the time.

### Wheel Truing Expense

The fear of most people that the truing of the wheel makes grinding expensive is a natural one, but should be set aside. Work with close limits and severe requirements can only be accomplished in most cases by the grinding process. True cylinders, absolutely round within .0001 in. can be produced by no other means than the grinding machine. Hardened steel parts which must be shaped can only be brought about by grinding. It is a question of dollars and cents. A generous use of the diamond increases production, insures the accuracy of the product and gives satisfactory results, and, with this, different degrees of finish can be accomplished by truing the wheel so that the face will be smooth or sharp, thus bringing about the desired result.

The wheel is trued to the shape desired by using a diamond carried in an

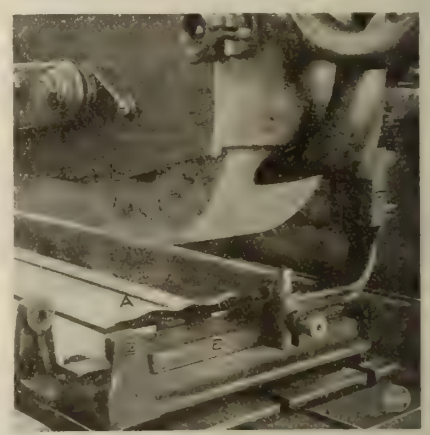

FIG. 6.

attachment designed for the purpose of producing this form.

On the line drawing are shown some illustrations of various shapes and forms that have been ground, which represent only a few of the possibilities of form grinding in connection with the following articles: Sides of skate blades, rifle barrels, gun barrels, pistol barrels, crankshaft bearings, roll necks for rolling mills, projectiles, pulley

FIG. 7.

faces, roll faces, ball bearing ball races, irregular shaped castings for machine parts, form cutters, shrapnel shell, etc.

### Forming Devices

Forming devices may be divided into two classes—those which simply form a

radius or a concave in the wheel, and those which form irregular shapes. Attachments that form a radius or concave in the wheel are known as radial truing

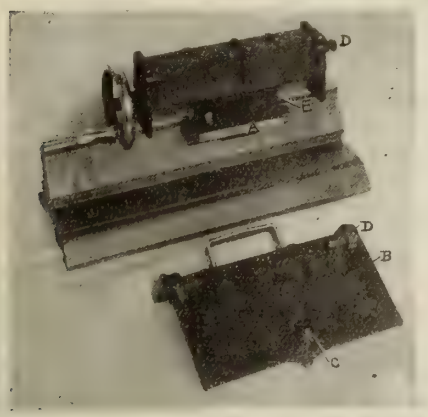

FIG. 8.

devices, and are of a number of different designs, illustrated by Figs. 2 to 5. They can be applied to many designs of grinding machines, and all operate on the same general principle, that is, they swing about a fixed point which forms the pivot, and by varying the distance from the diamond to the pivotal point, with the wheel, variations in the radius formed are produced. They are used extensively for forming the corners of wheels to produce fillets on roll necks, crankshafts, camshafts, all forms of spindles, shafting, etc., and are more commonly used with the straight face wheel. The limitations are dependent on the distance that the diamond can be moved from the pivotal point, which in the smaller attachments amounts to 1 in. radius, and on the larger attachments up to 3 in. radius.

Means are provided for locking the swinging member of frame in a position where the diamond can be used for truing the straight portion of the face of the wheel, and as is evidenced from the

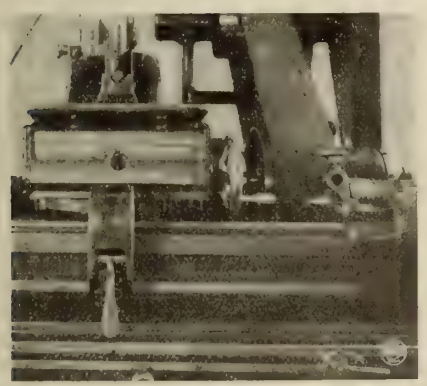

FIG. 9.

photographs, they are all convenient for use, easily accessible and have all necessary adjustments.

Fig. 2 shows the attachment as carried on the footstock, permitting of its remaining in place during the operation of grinding work resting on the centres of the machine.

Fig. 3 shows an attachment which occupies a space on the table, and can only be used when the work is removed from the machine. It is quickly put in position and locked by a ball lever handle, and has the advantage of having the swinging frame supported at both ends, but with this design it is only possible to true a ⅜ in. radius.

Fig. 4 is a fixture for truing a concave in the wheel, and this particular design is so arranged that each fixture is made for one particular radius, an adjustment of less than ¼ in. being provided. These attachments are built to take radii anywhere from 1 in, up to 12 in.

Fig. 5 shows a device for truing a radius on a wheel used on the surface grinding machine.

Forming devices, illustrated by Figs. 6 to 10 operate on a different principle. To get the irregular forms it is neces-

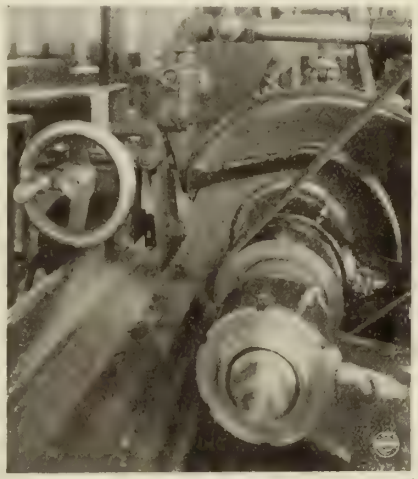

FIG. 10.

sary to first have a master form, which will cause the diamond to move through a path across the face of the wheel, which will produce the exact shape desired. This is clearly illustrated in the photograph (Fig. 6) of the attachment for the surface machine at A. As the roller travels across this former, the plate "B," carrying the diamond C is caused to move about the pivots D, making the diamond rise and fall, and producing the desired shape in the wheel. The movement is brought about by slide E which is actuated by the lever F fastened to the wheel slide. This is the same general principle employed in all of the forming attachments, modified only to suit the conditions under which they are used.

Fig. 8 illustrates this same type of attachment as applied to a cylindrical machine, the former plate being shown at A, the diamond carriage B, the diamond at C, the pivots at D, and slide at E.

Fig. 9 shows the same attachment mounted on the machine in place, ready for truing. Cuts and data are courtesy of the Norton Co., Worcester, Mass.

## CHATTERING TAPER REAMERS.

HOW many of us at one time or another have been afflicted with a machine taper reamer that would insist on chattering, despite our every endeavor to "dope" it Slow speeds were used in vain, and after stoning the cutting edges for half an hour, the next attempt at using it still produced a beautifully rifled hole. Sometimes this treatment was a success; sometimes notching the cutting edges improved matters.

All these remedies are at best only palliatives, as would be realized if one of the principal causes of chatter were fully understood. In nine cases out of ten it is due to an insufficient number of teeth in the reamer taken in conjunction with the weakness of the walls of the work.

To exaggerate the conditions, imagine the effect of forcing a rather dull three flute reamer into a thin walled tube. The result is that the walls take up a triangular form as the reamer alternately cuts and rubs. Similarly, in less extreme cases, the work assumes polygonal form according to the number of teeth in the reamer.

It is usually rather late in the day to attempt to cure a reamer of chattering when it is found to do so, for the fault is generally in the design. The remedy lies in using one with more teeth, and the designer will have to use his judgment as to the most suitable number for the job under consideration. This number cannot be increased indefinitely, as there must be sufficient chip space in the flutes. No hard and fast rule can be laid down for the number of teeth, and each case must be considered on its merits, working on past experience, the only reliable guide.

In the case of work with extremely thin walls, it is better to abandon a reamer altogether, using in its place a single point tool and the taper attachment. Another, though less common occurrence of chatter, is when small diameter reamers of proportionately great length are used. In this case the torsional stress causes them to twist up with the same result. The cure here is again by increasing the number of teeth, and thus strengthening the root diameter.

It may not perhaps be out of place to mention, in conclusion, that it is essential that reamer teeth should be unevenly spaced.—Herbert's Monthly.

# PRODUCTION METHODS AND DEVICES

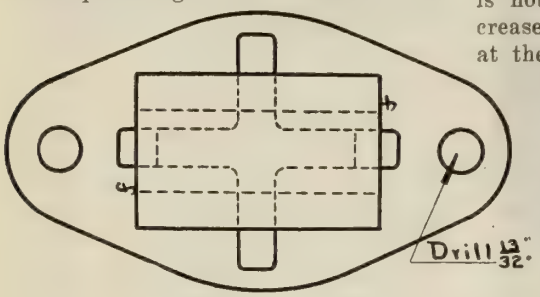
A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

## A MILLING AND DRILLING JIG.

By D. O. Barrett.

THE drawing in Fig. 1 is that of a rocker arm bracket for a gasoline engine. It is a malleable iron casting and the foot or bottom is finished by disc grinding, the piece in this operation being held freely by hand as no fixture was necessary. It will be noticed that the two ends of the boss are machined and the whole through same is reamed.

After the bottom is disc ground, the ends of the boss are milled on the fixture shown in Fig. 2. This consists of a plain iron base plate A which is bolted to the milling machine table, being provided with keys on the bottom. The two arms BB are hinged near the centre and at one end are cut out to receive the foot of the bracket. At the back end of the plate, the stud S is rigidly fastened, and turning on this stud is a knurled nut N which is provided with a taper at the bottom, this same taper being cut on the ends of the arms B. The two arms are pulled together at this end by the heavy spring shown in the top view.



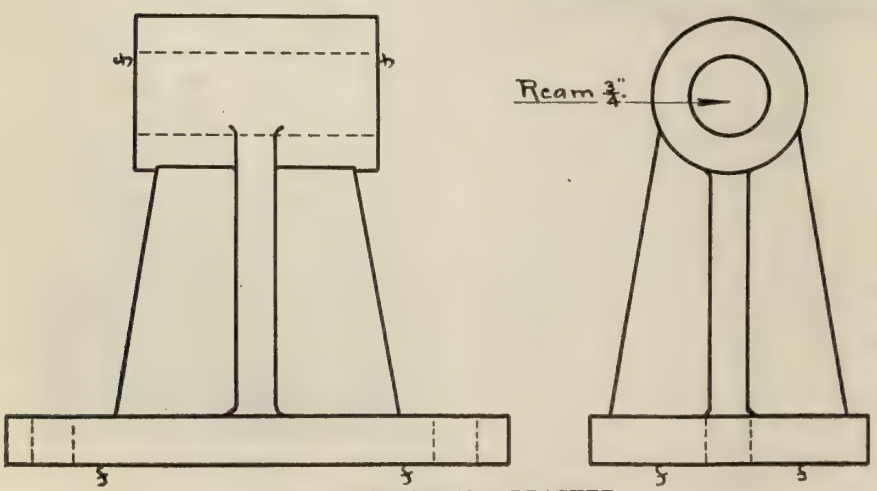


FIG. 1. ROCKER ARM BRACKET.

It will be seen that screwing down the nut N will force out the two arms evenly, and will thus accurately centre the piece held in the other end. The nut is provided with a coarse knurling, and the pressure necesary to operate this nut and clamp the castings very firmly is not great, as there is quite an increase of leverage. The shoulder screws at the front end of the arms serve to keep them in position and prevent them rising when clamping the casting. The clamp D holds down the castings by means of the eccentric arm at the top. This arm is attached to the eye-bolt, so that any desired adjustment can be very readily obtained by turning this bolt and clamping at the bottom. A heavy spring not shown in the drawing, is slipped over the eye-bolt and pushes up the clamp D as soon as the arm is released. At the rear end of the clamp a hole is drilled which fits over a corresponding pin on the end of the large post, this post being screwed into the base-plate at the bottom. This keeps the clamp in position yet does not interfere with its vertical motion.

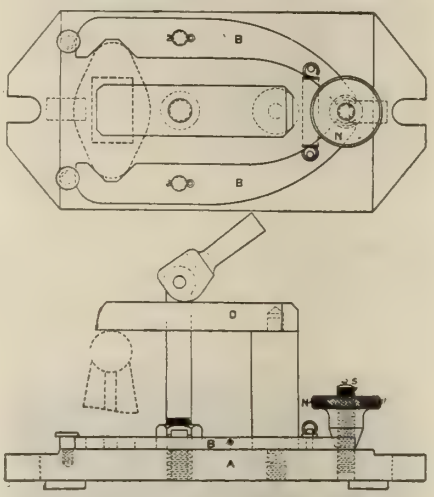

FIG. 2. MILLING FIXTURE.

After the ends of the boss are milled, the three holes are drilled and reamed in the fixture, Fig. 3. This is a box casting having a sliding steel V-block V which is operated vertically by means of the screw shown. The sides of the box are brought in at the bottom and are planed to the exact width of the boss on the casting. The back of the V-block is extended out and a corresponding slot is planed in the sides of the box, thus preventing the V-block from moving out as the pressure of the screw is brought to bear upon it.

In operation, the boss of the casting is placed in the V-block, and, by turning the screw at the top, the casting is forced up against the under side of the top. This accurately centres the casting with respect to the boss in both directions. A slip bushing is provided for the hole in the boss for reaming. The jig is slid along the drill press table between two parallels clamped to the same, and after drilling the two holes at the top, the jig is turned over one-quarter revolution and the large hole drilled and reamed. This makes a fairly quick-acting device, but, what is more to the point, one that will accurately locate the part with respect to previous machine work. A hardened steel washer, not shown, was used between the head of the screw and the top of the box to take the wear at this point, and two heavy springs were placed along the lines CC in order to positively push down the V-block as soon as the screw was loosened.

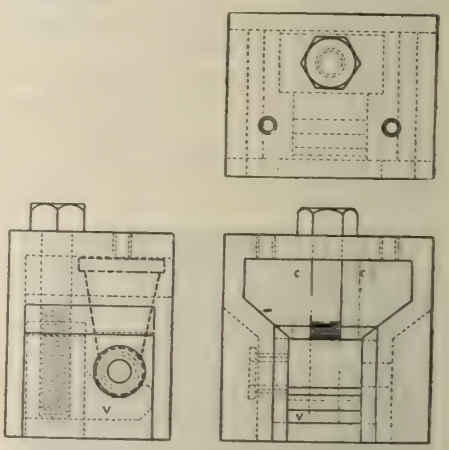

FIG. 3. DRILLING JIG.

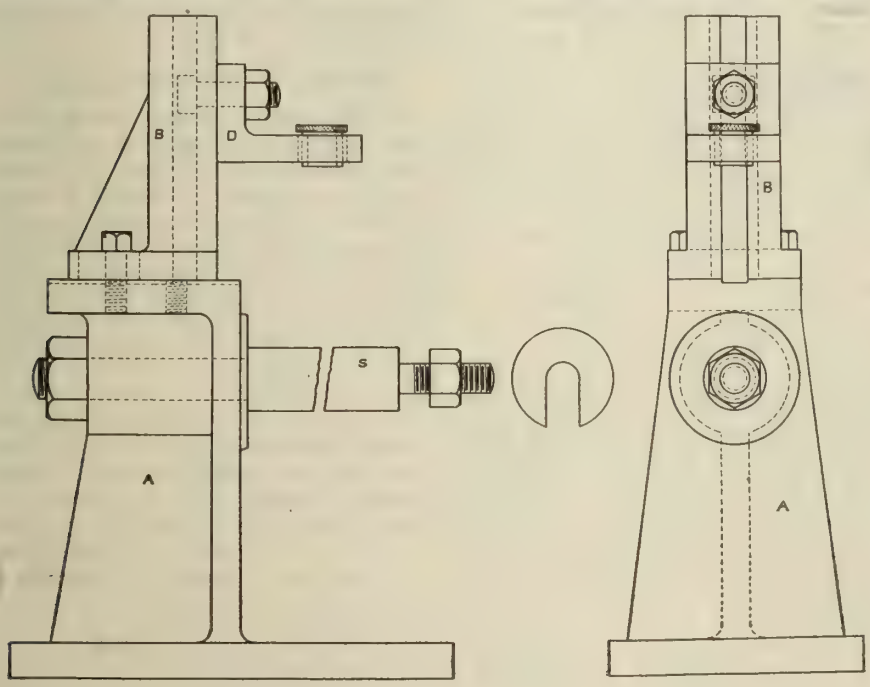
## FASTENING LOCK SCREWS.

By D. S. Mann.

WHERE set-screws are used to hold piston pins and studs, the usual practice is to either flatten the pin slightly where the point of the screw rests, or drill a shallow hole. These set-screws are prone to work loose, especially when used in gas engine pistons, even though they are provided with lock-nuts. The writer has found the following to be a very serviceable method, both for retaining the pins and preventing the screws from working loose.

A hole is drilled in the pin about one thirty-second smaller than the size set-screw used, this being drilled to a depth of about one-half inch. For piston pins it is, of course, necessary to drill these holes before hardening. When the set-screws are put in they are run down the hole in the pin. The thread of the screw will, of course, cut a corresponding thread in the pin, and, if the pin be hardened, the thread will be flattened somewhat. The friction of the screw in the hole will successfully prevent it from working out, this being especially true where the threads have been slightly flattened.



ADJUSTABLE DRILLING FIXTURE.

## AN ADJUSTABLE DRILLING FIXTURE.

By A. L. Loy.

IN the cut is shown an adjustable drilling fixture for such work as oil holes and set-screw holes for pulleys, gears, or collars. Where much of this work is done a multitude of fixtures would be necessary to cover all the requirements. This particular device is made adjustable in all directions so that the range covered is quite large. The amount of adjustment in each direction, of course, depends upon the work to be done, and will vary in different shops.

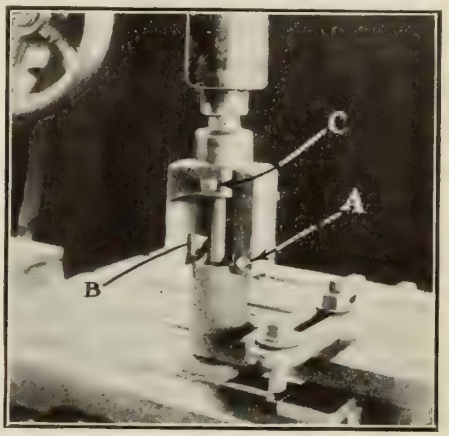
The base A is provided with a foot for clamping to the drill press table. The stud S carries the pulley, and is held in the piece A by means of a nut at the end. The outer end carries a nut which is small enough to pass through the hole in the pulley, while the pulley is held on the stud by means of a slotted washer which is dropped in back of the nut. The top of the base is provided with a plain groove in which slides the piece B, this being fastened by means of two cap screws. Slots are provided in B giving a similar range of adjustments parallel with the bore of the pulley, while several holes are tapped in the base piece allowing the cap screws to be placed in different positions. The angle D is arranged to slide vertically in B, this being provided with a T-slot. The sides of the slot are planed, and a corresponding key is fitted to the angle. The angle is provided with a fixed bushing so that various sizes of slip bushings may be used.

With much work of the varieties mentioned, a fixture of this kind will readily pay for itself in a short time.

## HOLLOW-MILLING ROCKER ARMS.

By A. E. Granville.

ONE of the most awkward pieces of work to handle in a railroad shop is a rocker arm. These may be handled to advantage, however, on a radial drilling machine, or a good heavy plain one. The latter is not so convenient, as it requires more trouble to set correctly. The rocker arms may be clamped to the table, drilled, bored and reamed, and then hollow milled, as shown in the illustration.



HOLLOW MILLING ROCKER ARMS.

The tool is made from a steel forging made in the blacksmith shop, the two wings each carrying a cutter. These cutters are held in by set screws, one of which is shown at A, and are easily adjusted for different sizes. The pilot B is held into the body of the tool by means of a set screw C. Various sizes of pilots are kept for the work done and are easily substituted for the one in place.

Sometimes it is advisable to make these tools with only one arm and one cutter, in which case the work becomes a turning operation and not a milling one. While slower, a single cutter has a number of advantages that need not be explained to a practical mechanic.

NOISE is a very important cause of industrial accidents. Noise and fatigue might properly be coupled together, because fatigue is often the direct result of noise. Be this as it may, it is certain that noise is often the direct cause of accidents, a typical case being that in which a machine slipped from an overhead crane and fell on to a workman. The crane operator saw the machine slipping and shouted to the workman but was unable to make him hear because of the noise in the shop. Steps toward the elimination of unnecessary noise are now being taken by the managements of progressive industrial plants. Not only is this a means of providing for the safety of the operators, but experience has shown that more work can be done in a quiet shop, that there are apt to be fewer mistakes made, and that the quality of the work will be improved. These are certainly points that the up-to-date manufacturer cannot afford to overlook.

# Notes and Observations on Modern Foundry Practice—*

By R. Onions

*In the introduction to his paper, the author referred to the fact that the art of ironfounding was in existence previous to the written records of history. He at the same time hazarded the suggestion that to the scientist and practical man of to-day it offered not only a wide field for research, but one also in which individuality had the widest possible scope.*

IN these strenuous war-time days, the iron foundry is not conspicuously prominent either in its production of war munitions or its development demonstration. Its devotees are neither idle at the desk nor on the floor, however, and, if for the nonce, the steel mill and the forge divide the honor of premier place in industrial engineering enterprise, the day is becoming appreciably nearer when the iron foundry will again assert its claim and demand whole-hearted attention.

In what follows in our present and immediately succeeding issues, sufficient of the substance of the subject matter discussed by the author in his paper will be reproduced, so as to give an idea of the comprehensiveness of the detail embraced and incidentally re-awaken the interest of foundrymen to the achievement possibilities of their craft and calling.

### Core Making.

Good results are obtained by the use of sea sand and oil for certain classes of core work, such, for instance, as the core required for the combustion chamber of gas or oil engine and steam ports of cylinder, where the core is entirely surrounded and good venting is necessary. A man will take five or six hours to make the water jacket core irons for a gas engine of 100 h.p., and a great deal of care is necessary to have the vents from all the parts to the outlet. Such a core is well suited for oil sand, and, when it is used, no grid is required, as the core dries so hard that a few irons crossed and tied for lifting purposes are all that is wanted.

It is difficult to understand why oil sand cores are not more widely used. The labor question has a considerable influence, but when judiciously introduced and men see that they will work satisfactorily, they are looked upon with more favor. One objection to guard against as far as possible is the smell from fish oils. Two parts of whale oil and one part of boiled linseed oil work well.

The bending of core irons in wooden core boxes is responsible for a good deal of damage, involving pattern shop repairs. Bad work and delay creep in if patterns and core boxes are allowed to deterioriate. A periodic examination and general clean up and varnishing is good practice; it leads to the worker taking more interest in his job; and tends to recruit a better class of man.

When quantities enter into the question, labor-saving devices should be considered, and by attention to details which go towards eliminating the fatigue of the operator, particularly where girl labor is employed, the output will be enhanced. It should, therefore, be an axiom not to do anything by manual labor which may sensibly be performed by power. The illustration on next page shows such a device, being a pneumatic core box cramp, which is operated by the opening or closing of the air tap.

### Green or Dry Sand Castings.

The main points to consider when deciding what castings to make in green or dry sand are, the amount of machining on the finished piece, the cost of the mould and the number of cores it contains; the risks in closing, and the class of skilled labor available. The human element also steps in to a very considerable extent.

For dry sand, one first class, and, say, three indifferent moulders, may form a squad. The leading hand should be employed in finishing and closing, and the others in ramming up and partly finishing. For green sand, every man must know his job, the drying very often making good the defective venting and ramming which would be quite fatal to the green sand mould. Dry sand castings are not so sharp as green sand; the difference being quite noticeable in fine pattern work.

There are many quite elementary points which are found in actual practice to be missed, and so cause serious leakage in the way of lost work. A pipe for example should not be rapped sideways, but tapped lightly on both ends with a wooden mallet. Rapping sideways tends to disturb the sand along the edge of the box, nevertheless, it is the practice with moulders to loosen pipe patterns sideways. The advent of the moulding machine with its vibrator has shown that patterns of quite moderate size can be satisfactorily loosened by quite light tapping. Gaggering of dry sand moulds is generally much overdone, and it is one of the many details of moulding where men may be working hard and still wasting their time. In ramming a green sand mould, care should be taken never to go too close to the pattern, as this is the sole cause of many scabs. Pneumatic rammers shake the arms, and, partly owing to this, the moulder cannot feel the degree of hardness the same as with the hand tool.

Compressed air service at 80 to 100 lb. square inch pressure with convenient connections for india rubber tubing is an advantage for blowing out dust and pieces from deep dry sand moulds. The same connections may be used for crude oil burners, which are sometimes used instead of coke buckets for skin drying green sand molds. Iron molds may be made to supersede a good deal of open sand castings, such as grids, anchors for holding down bolts, core grids and such castings that have taper on all sides.

### Moulding Machine Advantages.

The foundry in order to be on equal terms with the machine shop must produce with precision also. Castings which are uniformly rammed, loosened and drawn by machines must score in this respect over those produced by hand moulding. Some form of moulding machine where the pattern plate is easily and cheaply made, and is capable of being worked by unskilled labor, is a great advantage.

When making wood patterns, the management cannot always say whether or not any particular detail may become a standard design before trial, and so a difficulty comes in to determine whether it should be machined moulded.. Patterns intended to produce moulding machine plates are sometimes required to have a double contraction. This difficulty is best met by adopting a class of metal which will have little or no contraction: the material should also resist corrosion and not be too brittle. The following mixture of metal is cheap and meets the conditions well:

| | |
|---|---|
| Lead ... ... ..... | 85% |
| Antimony .... . ..... | 10% |
| Tin ..... ... ..... ... | 5% |

In all moulding machines, except the class where a stripping plate is used, the method of first starting the draw should be so under the control of the operator that any degree of movement may be obtained whilst the vibrator is still in action, as moulders know it is on the first attempt to disturb the pattern that damage may be done.

*From a paper read recently before the Manchester Association of Engineers.

Centres of pin holes and sizes of boxes are important matters to determine, as they soon multiply in number, and changes afterwards cannot well be made. These dimensions are settled by the class of work and when decided upon, jigs are necessary for drilling pin holes in frames of machines which will correspond exactly with those in moulding boxes. Good jointing is essential for accurate work, and this can only be obtained by keeping all pins and holes in good condition. The holes stand well if bushed with 3 per cent. nickel steel, and pins resist corrosion when made of the same material.

### Plate Moulding.

Plate moulding may be said to come between the ordinary moulding with loose patterns and the moulding machine. Like all other classes of moulding, it has its sphere of usefulness in practically every foundry. The principal advantages gained are that by it a good joint is assured, the plate being extended over the box, the pins forming a guide when drawing the pattern off by hand, so that less patching and mending is required, and the castings in consequence come out cleaner and nearer to the actual size of patterns. The machining allowance can also be less.

The general trend of engineering demands from the iron founder more complicated castings, capable of standing higher fluid and gas pressures, greater stress and sliding surfaces to work satisfactorily up to 900 ft. per minute, and to have test pieces cast which must satisfy severe transverse and tensile tests. The foundry man meets the conditions demanded sometimes by the grading of metal or the placing of running gate or risers over particular places, whilst cases will occur where all ordinary methods fail and the desired result after many trials is only possible by the application of a chill or densifier at some particular spot.

### Chills.

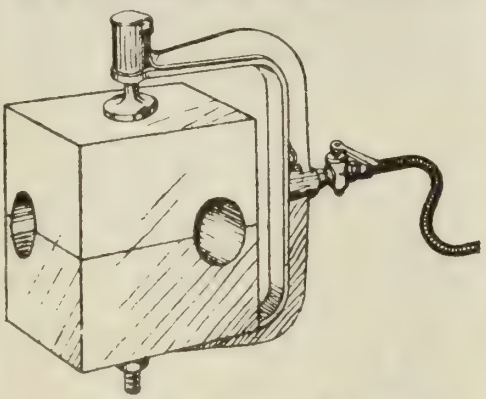
Chills may be cast in the body of castings and remain as part of the finished product, as in the case of flywheel bosses, where a ring of cast iron may be placed in the heavy section, but clear of the machined surface. We have also the class of chilling to obtain from one grade of metal, two distinct grades in the casting, such as a hardened surface to stand wear. The hardness or denseness obtained bears a relation to the respective massiveness of the chill and the casting, or the time they are allowed to be in contact. In applying chills, it is therefore necessary to leave the surface so that it can be machined and to have the chilling effect so deep that after machining the surface is sufficiently hard.

Various types of fettling-shop rumblers capable of holding up to five tons, are made, and these seem to impart some property which appears to be beneficial, probably by helping to set free contraction and skin stresses, and so making the casting more normal in this respect.

### Cupola Management.

The cupola and its management may be considered the section of ironfounding offering the widest scope for investigation, and considerable skill and experience must be exercised in the design, building, and working if the operations are to be carried out to give, in regular work the best results.

Amongst the many modifications or special appliances added to the ordinary cupola which have for their object the reduction of coke consumed per ton of iron melted, probably the one which makes the strongest appeal is that patented by Greiner and Erpf. These inventors claim that with a second row of comparatively large tuyeres the burning is so concentrated, and thus the temperature maintained is so high, that the carbon dioxide formed is sufficiently hot to react on hot coke and form carbon monoxide again. Their cupola has one main row of tuyeres, and then a series of small tuyeres distributed for a considerable distance up the cupola. The idea of this arrangement is, that by supplying the extra air in small quantities, they burn all the carbon monoxide without raising the temperature of the coke high enough to be followed by the reaction of the carbon dioxide again.



PNEUMATIC COREBOX CRAMP.

Experiments have been made with the Greiner and Erpf's air distributor and other experiments with the ordinary tuyeres in the way of sending the blast in different directions, such as obtaining a swirling motion, directing the blast downwards and with the openings made to increase the velocity to send the air to the centre. These went to confirm that the tuyeres arranged horizontally and directed towards the centre, with an increasing area to give a soft and well-distributed blast, having a velocity not exceeding 2,500 ft. per minute, will give good all-round results; the lining under these conditions being easily repaired and the shape readily maintained.

A receiver attached to the side or bottom of a cupola appears to claim a good many advantages. By mixing thoroughly the various grades of metal, and by allowing the metal as it melts to flow away from the influence of the coke, it will pick up less of its impurities. It also has the advantage that, by taking away the slag, apart from the furnace proper, the coke is not brought down so quickly; on the other hand, it takes a little longer to get hot metal than is the case with the ordinary cupola.

Attempts have frequently been made to economize the fuel by connecting the top of the receiver to the cupola and so making use of a hot blast. With such an arrangement difficulty is experienced owing to the connecting pipe getting choked with a kind of slag deposit, impinged quite hard against the interior, in the form of sparks. Temperature has a considerable influence on the microstructure of castings. For one cause or another, various castings have to be cast at different temperatures, so that practically every casting will have a corresponding casting temperature to suit all-round conditions.

### Castings Cost.

When considering the question of costs of castings, we must look at it from a point which goes beyond the foundry—as, after all, this is only one of several sections of an engineering works which go to make the whole. Here, then, it is necessary to exercise a good deal of sound judgment, which can only come by long experience. For instance, a slight increase in foundry costs may result in a large decrease in finishing costs. Certain holes, say, in a bedplate, may do quite well if cored, but from their position in the mould the risk of a "crush" may be too great to set against the drilling time.

### Management and Organization.

On drawing this paper to a close, it may be as well to pause for a moment and ask ourselves the question, "What does successful iron founding mean?" However necessary good equipment and tools may be, they are useless in the hands of bad management and poor organization. It may be conceived on this score alone that the so-called out-of-date shop may beat a foundry equipped on the most up-to-date lines. Clearly then it is not so much the equipment we have to look to, as the supervision and the skilled men of the foundry, and as they are the men who earn the profit, everything possible should be done to relieve them of anything which may take them off their job—in short, the skilled man is no use when laboring.

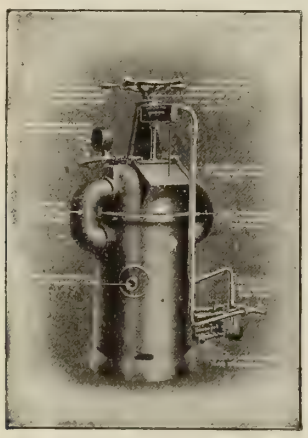
# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## AN ALUMINUM FURNACE.

THE application of aluminum and its alloys to industrial purposes has extended so considerably in recent years that the subject of their melting is bound to appeal to a large number of manufacturers. Generally, the melting of these metals has been effected in open crucibles, which allow atmospheric oxygen to attack the molten metal with the consequent formation of dross. Other drawbacks to melting aluminum in this manner are well known to those familiar with the subject. A gas-fired furnace, on what are claimed to be entirely new principles, for melting aluminum and its alloys has been evolved after many experiments by the Monometer Mfg. Co., of Aston, Birmingham, England.

Melting pots made of metal are subject to the objection that the re-action



AN ALUMINUM FURNACE.

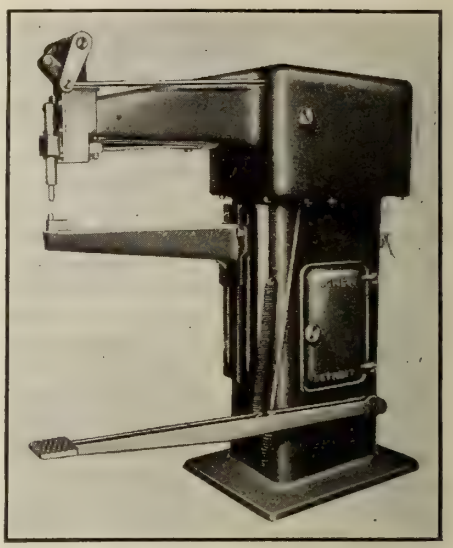
which takes place between the molten aluminum and the impurities in the metal of which the pot is composed, spoils the aluminum. In the furnace in question, this re-action is claimed to be eliminated by the employment in the parts subject to attack, of a special composition of metal, which extended experience has shown to be perfectly resistant to the action of impurities. It is well known that a considerable proportion of the molten metal goes to waste as oxide, and to prevent this deleterious action, the melting pot is installed in a chamber containing inert gases incapable of oxidising the molten metal. As there is no oxidation, it follows that there is no dross, and hence considerable saving of material. The method of constantly replenishing the enclosed melting chamber with inert gases, consists in causing the products of combustion to traverse the melting chamber on their way to the outer flue. This sealing of the melting chamber precludes, further, the ingress of dirt and other foreign matter to the melting pot.

Turning to the heating arrangements, we find that a very ingenious device is incorporated in connection therewith, in order to take care of the gas supply when the melting point of the metal has been reached. The thermostat of the patented regulator, termed by the makers a "Monometer," controls and governs the quantity of gas supplied to the burners, so that immediately the aluminum is melted the quantity of gas combusted by the burners is reduced and the uniform heat essential to the melting of aluminum is automatically maintained. The Bunsen burners under the melting pot are of novel construction, having contracted nozzles of such a design that a proper admixture of the gas and air is secured and therefore the fullest utilization of the heat in the fuel. The heat obtained by these low pressure atmospheric burners, which are coupled to the ordinary town supply, is comparable with that attained by high-pressure gas, but without using compressors or fans.

The equipment of the furnace is completed by a central cone valve seated in the bottom of the melting pot and controlled by a conveniently arranged handwheel by which the molten metal issuing from the pouring spout can be regulated or entirely shut off. At the top of the furnace are located two doors through which the swarf or metal is introduced into the melting pot, these doors being balanced so that they remain either in the closed position or in the open position, without being held by the operator. To facilitate casting, the furnace is mounted on a wheeled carriage which can readily be moved on the rails from one part of the foundry to another, flexible gas pipes being, of course, a necessary auxiliary.

## ELECTRIC SPOT AND BUTT WELDING MACHINES.

IN the new line of electric welders recently brought out by the Agnew Electric Welder Co., Detroit, Mich., the most important are two spot welders and a butt welding machine. A feature of both spot welding machines is that the working points are water cooled by hose and pipe inside the machine underneath the transformer. The high-tension wires are also housed inside the frame so that accidental contact with them is impossible. The regulating panel is inside the frame, access to it being through the

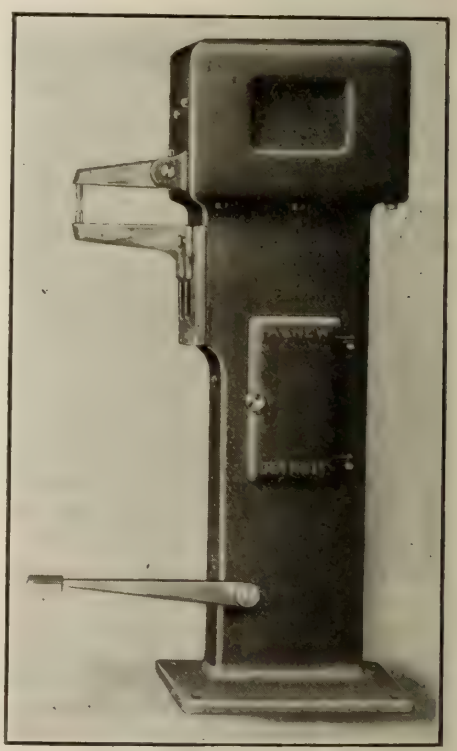


NO. 20-D SPOT WELDER.

door on the side of the frame. All working parts of both types are accessible and designed for hard service.

### The 10-D Spot Welder.

The smaller or 10-D machine is of the pivoted type, and is equipped with a foot lever which automatically applies the current, the operator having free use of



NO. 10-D SPOT WELDER.

both hands. A regulating switch for welding any thickness of metal within its capacity of No. 18 or 14 gauge steel is provided. The depth of the throat is 10½ in.; the adjustment of the lower horn, 6 in.; height from floor to work points, 41 in., and transformer capacity, 12½ kw. This machine will make 500 welds on No. 18 gauge; 900 on No. 22 gauge; 1,500 on No. 26 gauge, and 3,000 on No. 30 gauge steel with a current consumption of 1 kw.-hr.

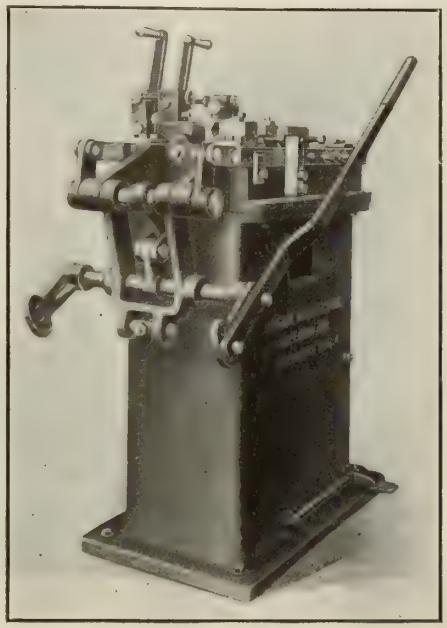
### The 20-D Spot Welder.

The larger type of spot welding machine, the 20-D, has an adjustable horn, so that, with the use of a long point, welds can be made at the bottom of deep cylinders, battery and tool boxes, etc., and the horn is arranged so that any kind of attachment can be put on it for welding on the inside of odd shaped pieces. In this machine the up and down movement of the upper electrode is secured by toggle joints. It is regularly equipped with a foot lever which automatically applies the current, but a hand lever may be attached if desired. Regulation is provided so that metal of light thickness may be welded without danger of burning. The transformer is designed for continuous and rapid service up to its capacity without overheating. Its welding capacity is No. 10 gauge steel and lighter. It is made in four sizes with depths of throat of 18, 24, 36 and 48 in. The adjustment of the horn is 10 in. and the height from the floor to the working points is 40 in. The transformer capacity is 20 kw. The machine will make 160 welds on No. 10 gauge steel; 350 on No. 16 gauge; 900 in No. 22 and 2,250 welds on No. 28 gauge steel with a 1-kw.-hr. current consumption.

### The 20-C Butt Welder.

The butt welding machine, designated as the 20-C, has a number of special features including an extended movable rear carriage which is pulled against the work instead of being pushed, to prevent any tendency of the work to buckle under heavy pressure. The carriage slides in ways located at the front and rear of the opening. The extended movable carriage adds to the rigidity and allows the bearings to be located so that particles of chilled metal cannot get to them and cut the bearings. The movable carriage is gibbed to take up the wear. The forward carriage is adjustable vertically and crosswise, making it unnecessary to shim or remachine this to correct alignment. The necessary pressure is applied by a vertical lever operating a compound toggle movement that is adjustable to secure the greatest leverage at any desired position of the carriage.

A second lever is attached on the rear, and the machine is operated by two men, avoiding the necessity of using a hydraulic ram on heavy work. It is equipped with clamps for welding either rounds or flats. A current regulator and water-cooled dies form a part of the equipment. The machine illustrated has a welding capacity of ½ to 1¼ in. rounds



NO. 20-C BUTT WELDER.

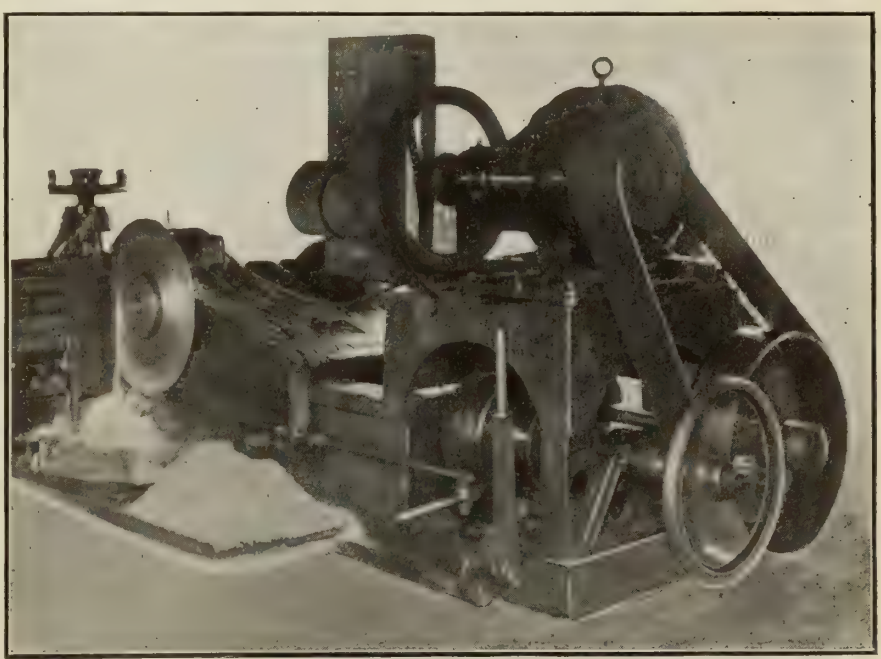
or ⅛ x 7-in. flats. The stroke of the carriage is 4 in. and the carriage opens 4½ in. The height from the floor to centre of work is 42 in.; the floor space is 22 x 34 in., and the transformer capacity is 30 kw. This machine will make 11 welds on 1¼-in.; 18 welds on 1-in.; 38 welds on ¾-in., and 135 welds on ½ in. round bars with a current consumption of 1 kw.-hr. It is also built on three other sizes, two smaller and one larger.

### MULTIPLE BAR SAW.

THE manufacture of shrapnel and high explosive shells has been responsible for an extraordinary display of ingenuity in the matter of production methods and devices applicable to standard equipment. No less true is it that relative to special purpose machine tools, there has been an equivalent degree of achievement. In the operation of sawing the shell billets to length from the steel bars as received from the mill, the illustration shows one of seven Espen-Lucas Machine Works, Philadelphia, saws installed at the plants of the Steel Co., of Canada, Hamilton, Ont.

These machines are very heavily constructed, and with a Westinghouse back geared motor drive, a periphery speed of 30 feet per minute is got at the saw, as well as sufficient power to carry any reasonable feed per minute. This combination is a very desirable one from the standpoint of the life of saws. The machine is equipped with multi-bar holding jigs, holding five bars at one time, the bars beng jigged in circular form, so that the time of cutting one piece really covers the time of cutting all of the five.

The saw blades are of vanadium steel, and the saw teeth of the best high speed steel. All the bearings on the machine are bushed with bronze, while all steel parts are made of high carbon forgings. The feeds are variable and automatic, and are furnished with automatic throw-out, which disengages the feed at any predetermined point. Automatic quick return withdraws the saw blade on completion of cut, and all operating levers are located conveniently at one point.



MOTOR DRIVEN MULTIPLE BAR SAW.

The saws range from 30 in to 34 in. diameter according to the size of the work, and the weight of the machine shown runs to about 16,000 pounds.

## 100-INCH DRIVING WHEEL LATHE.

A RECENT product of The Niles Tool Works Co., Hamilton, Ohio, is that of a 100-inch driving wheel lathe. The accompanying cuts show the general design of the complete machine and one of the face plates in detail respectively. The capacity ranges from 32 7-10 ins. to 94½ ins. diameter on the tread. The maximum distance between face plates is 11 ft. 2¼ ins., and the minimum distance is 6 ft., 8 ins.

The face plates are 100-in. diameter and are arranged with recesses so that the outside cranks can enter and permit sliding members carrying centres to be located in proper positions. For holding the wheels, "Sure Grip" drivers are provided, four to each face plate. These engage the tire directly and hold wheels absolutely rigid under heaviest cuts.

The face plates are driven by large diameter gears bolted to their back faces. The driving pinions which engage the face plate gears can be thrown out of mesh so that the speed of the left hand face plate can be increased through an auxiliary train of gears when the machine is used for journal turning. To facilitate handling wheels in and out of the lathe an independent motor of 10 h.p. is provided for traversing the right hand head. The drive is through a friction clutch controlled by a lever placed at the front of the machine, within easy reach of the operator.

The bed, which is of massive construction, is 22 ft. x 11½ in. long. The front portion, upon which the carriage rests, is moved out 10½ ins. from the main bed. The maximum distance between face plates permits wheels with outside counter cranks to be rolled into the machine without interfering with the driver dogs on the face plates. Tracks

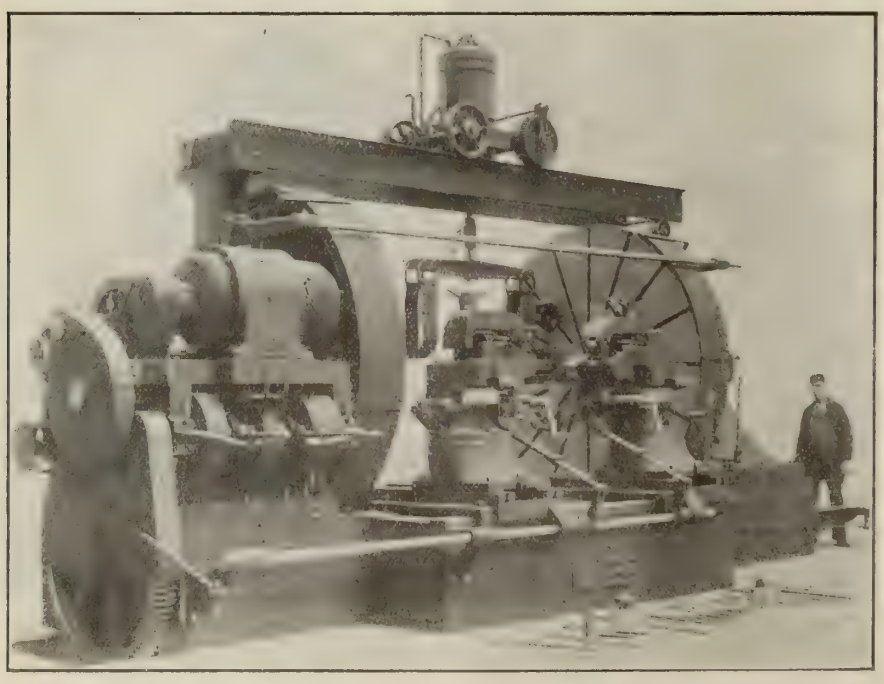
FACE PLATE DETAIL OF 100-INCH DRIVING WHEEL LATHE.

are located on the bed, so that wheels can be rolled to the centre of the machine.

Tool rests are of massive construction and are arranged to swivel to give the proper angle for the taper of the wheel tread. The tool rests are equipped with pneumatic tool clamps, which hold the tools rigid or release them instantly by a hand operated valve, making possible the changing of tools in a few seconds.

The drive is by means of a 30 h.p. direct connected motor, having a speed range of from 500 to 1,500 h.p.m. Through an auxiliary train of gearing suitable speeds are provided for journal turning.

The machine is equipped with a pneumatic hoist, carried on two 12 in. channels located above the machine. The hitch to the axles is made by using two slings of belting. The standard calipering attachment consisting of a bar and gauge is provided. The machine is also equipped with an Andrew's calipering attachment, which consists of scales counter-sunk in the carriage and fastened to the tool slide base, together with a bar for setting the tool.



100-INCH DRIVING WHEEL LATHE.

## WHY NOT?

SOME years ago when the advantages of the limit gauge system were not as widely known as they are to-day, the writer, to impress one young fellow with the beauties of the system, took a gauge of the correct size for the work in hand and explained that one end of the gauge must go in and the other end should not.

After waxing enthusiastic, a very eloquent peroration was concluded with the remark that the hole being bored would then be less than one end of the gauge, but greater than the other end. The operator, however, remained quite unmoved, and quietly remarked that "it was about one of the silliest schemes he had ever come across; why not have a gauge of the correct size?"

## WAR EFFECTS.

Many shops will have an excess of plant.

They will have learnt new methods on the new machines they have installed for war requirements.

The old machines will no longer be able to earn their keep; they were not really able to do so before, but the fact had not yet been discovered.

It takes a war to wake up some people.

Much of the old plant will be discarded.

The new methods will become standard practice.

The demand for modern tools will be greater than ever.

Let us hope that this will be the case, but we must first win the war.

MacKinnon, Holmes & Co., Sherbrooke, Que., are completing the erection of a shell forging plant. The equipment part of which is now installed will turn out about 1,000 forgings per day for 4.5 high-explosive shells.

## NATIONAL ORGANIZATION OF LABOR.

AMONG many other things forcibly brought to our notice by the present international struggle is the absolute interdependence of the soldier and the maker of munitions for military success. Just as the miner, the steel worker, and machinist form a much larger element than the actual trainman in the success of a railway, so the men who stay at home may contribute a very large share to the defence of the nation.

The British army has more than upheld its most glorious traditions in the field, but has been handicapped by the insufficiency and inefficiency of the armies in the workshops at home. Great Britain has experienced less difficulty in the securing of three hundred thousand recruits for the army than in getting thirty thousand additional mechanics. The inventory and organization of factories and of the men employed therein has, however, now, become a department of the Imperial Government, and gives promise already to solve the problem of the army's mainstay.

The ability and promptness with which Canada has taken hold of a share of the manufacture of war supplies has been a source of astonishment to many foreign countries and the Canadian people have not been slow to accept such credit as has been accorded them. Canadian manufacturers and mechanics, however, are still far from doing their share, or more properly, have not been tested out to their capacity. According to population, the Dominion should furnish from one-seventh to one-eighth as much war material as is delivered by Great Britain, and on the basis of natural resources, a great deal more.

Canada is a far-flung country and furnishes a wider scope for organization than almost any other. To-day, while the manufacturer of munitions in one part of her territory is calling for men, there are suitable mechanics looking for jobs in another. It is said that Germany recently sent 4,000 skilled mechanics to Constantinople to build submarines and war machinery for the Turks. Would it not be a humane and patriotic duty as well for both our capitalist and labor organizations in this instance, to bring the man to the job and save him the necessity of replying to the more active efforts of foreign advertisers. The circumstance offers a valuable opportunity for labor and capital to get together and to give cooperation a thorough and conscientious tryout.

Facts are becoming known which indicate that Canadian skill and resources are not being organized to do all they can to serve the Empire at this momentous epoch in its history. The head of one of our leading industrial plants—as loyal a son of Canada as ever trod her soil—laid before us the details of an offer received from the Government of France for the supply to our ally of 500,000 shells, for delivery during the ensuing months of this year and the beginning of next. It was not a mere request for prices, but a request preferred because of the reputation for thoroughness and reliability which this firm has earned for itself.

France, as well as Britain, needs shells, and her agents are seeking those with the equipment and skill to supply them. To get them a good price is offered—better than from British authorities—and courteous and satisfactory assurances are given that as soon as the shells are delivered, as required, the cash will be handed over. More than that, our ally goes further and offers to the experienced and skilled manufacturer, a deposit with the order.

Attractive as this offer is, it will in all likelihood be turned down, not because of the price, unavailability of raw material, or doubt as to payment, but because of uncertainty as to labor. Strange as this may seem, in view of the campaign to take men from Canada to Britain, it is nevertheless true. While city officials are asking for assistance in "making work" for the unemployed, manufacturers are anxious lest they should fall down in the delivery of orders on hand through the steady drain on their staffs by the demand of Britain.

A shell made in Canada is as effective as one made in Britain. To take from Canada a man to make a shell in Britain is wasteful to the extent of the cost of his transportation, inasmuch as he could be made as serviceable in Canada as in any other part of the Empire. Canada has the plant to make munitions in Canada, the skill, the material, and the will, but nevertheless orders are going to the States because of the uncertainty due to the campaign to induce our mechanics to go to Britain.

# The General Market Conditions and Tendencies

**This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.**

**Montreal, Que., June 14, 1915.**—The recent appeal for more shells has apparently had its effect, for in all channels, increased activities are being evidenced. This business has seemingly thrown all other lines of trade into the background. Our steel interests are putting forth great efforts to get some French and Russian orders for shells placed in Canada, and these, being of large proportions, would, if placed here, give a tremendous impetus to our steel industry.

The iron ore and pig iron situation remains very quiet, and not much change need be anticipated before the end of hostilities.

Regarding the machine tool situation, matters are from week to week becoming more congested in lathes, most machinery houses transacting business along lines not unlike those of the stock exchange. Machines are bought and sold all in one day in many cases, while orders over the wire and telephone are quite common. The metal situation is showing the effects of the tremendous drain due to the extraordinary demand for munitions of war manufacture. Lead, spelter and copper are those which seem to be most in evidence this week.

### The Steel Trade.

Rail orders are being received in small quantities from time to time. The main proposition engaging the attention

of the steel mills at present, however, is the supplying of steel bars, billets, forgings, etc., for the manufacture of shells. In the course of a few months it is confidently expected that the manufacture of shells in and around Montreal will be greatly in excess of the even now huge proportions of the industry. At present the forging capacity of the various shops rather controls the situation. Nothing definite with regard to the extension of forging plants is meantime available, although great efforts to increase the output are being made. The rolling mills are arranging to take care of the heavy demand which will arise as soon as forging machinery can be installed. At the moment, steel men are awaiting development, and none contradict the fact that big things are in process of maturing. Foreign and overseas business with the colonies is in a ripe state to develop along extensive lines as soon as ships are procurable to carry the steel.

### Pig Iron.

Everything is very quiet in pig iron. Most foundries are still closed down, while others are only running on short shifts.

### Machine Tools.

The entry of so many firms into the manufacture of high explosive shells has caused further congestion and increased excitement in the machine tool trade. Heavy lathes up to 36 in. swing are in a greater demand than perhaps the world has ever known. The methods of handling this business are rather new to the trade. Manufacturers buy from one another to fill their respective orders and orders are received by wire or phone and accepted. Lathes are thus often shipped by the time letter confirming the order is received. The number of machines being sold is astonishing. It is hard to describe the situation, because to-day's description will hardly fit to-morrow's conditions.

Supplies are selling well and there is a great demand for high-speed steel. Jigs and fixtures are becoming more or less standardized and are finding a ready and free market.

Special machines for certain jobs and operations are being marketed with great success. Small millers to replace taps for operations on high explosive shells are commanding much attention, the taps on the market being apparently unsatisfactory.

### Metals.

The metal situation is developing new features each week. Copper is stiffening in price and will no doubt go higher. The demand for war munitions is increasing steadily. There seems to be more copper required every week. Unfortunately, a great deal of the copper used for driving bands on the shells will in all probability never be recovered. That entering into brass cartridge cases, of course, will not be lost. However, the price of copper continues to rise.

Tin remains stationary at 45 cents, which is excessively high. Comparatively speaking, tin has been quiet during the last week.

Spelter still sticks at 30 cents, which is a phenomenal price. It appears that there is plenty of ore in the mines in the United States but that the whole situation is controlled by the output of the refining plants. Hence the present scarcity.

Lead has gone up to 8 cents. No satisfactory reason can be given for this, but it is thought that the present large stocks are being manipulated.

The scarcity of antimony has caused the price to soar to 40 cents. It is impossible to obtain large quantities of this metal, and any slight increase in the demand sends the prices soaring.

Aluminum has moved up to 32 cents. It is supposed that an unexpected demand for use in aeroplanes and electric transmission lines has caused the sudden jump in price.

### CANADIAN GOVERNMENT PURCHASING COMMISSION.

**The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George Gault, Winnipeg; Henry Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.**

### COMING CONVENTIONS.

**Associated Advertising Clubs of the World, Chicago.—June 20 to 24.**

**American Society of Mechanical Engineers, Buffalo, N.Y. (Spring Meeting.)—June 22-26.**

**American Society for Testing Materials, Hotel Traymore, Atlantic City, N.J.—June 22-26.**

**American Foundrymen's Association, Atlantic City, N.J.—Sept. 27-Oct. 1.**

**Foundry and Machine Exhibition Co., Atlantic City, N.J.—Sept. 25-Oct. 2.**

---

**Toronto, Ont., June 17, 1915.**—There is practically no change to note in the industrial conditions, but an optimistic feeling is being maintained in business circles. This is due largely to the favorable crop reports and a belief that orders for war materials will continue to be placed with Canadian manufacturers. Business in ordinary lines continues slow and shows little prospect of any material improvement for some time. The activity in the shell industry is unabated and development is proceeding in a satisfactory manner. An interesting address was delivered here last week by General Bertram, Chairman of the Shell Committee, on the work done by this organization since its inception. The address revealed the important nature of the work and the rapid development that has taken place in the shell industry since last September when the first orders were placed. As the direct outcome of the work of the Shell Committee, a copper refining plant will be established in Canada which will be the first of its kind in this country.

The continued advance in the price of metals, particularly spelter and lead, has resulted in higher prices for a number of products in the manufacture of which these metals enter. The most important are galvanized sheets, black sheets, brass wood screws, lead wool, red lead, copper rivets, copper and lead scrap. Higher prices are announced for transmission rope and drilling cables, due to conditions in the manila market and increased freight rates.

### Steel Market.

The demand for steel bars and billets for shells is increasing and the mills have all they can do to meet the requirements. In addition to the order for shells from the British Government, it is anticipated that the French and Russian Governments will also distribute orders for a large number of shells in Canada. There is also a considerable amount of steel being used for rifle barrels. It is reported that the Ross Rifle Co. of Quebec are turning out 6,000 rifles per month, and have been obliged to refuse a large order from the Russian Government. There is only light demand for merchant bars and structural shapes, the building trade being very dull. Notwithstanding conditions, prices are very firm.

Conditions in the galvanized sheet trade are very bad owing to the unprecedented high price of spelter, which precludes the possibility of making and selling galvanized sheets at a profit, or even at cost. The result is a further advance in sheets of 25c per cwt. Since this advance the spelter market has weakened and the situation will probably improve if lower prices are maintained. Black sheets have advanced 10c per cwt.

### Pig Iron.

The market is still very dull and featureless with nothing of interest to report.

### Scrap Metals.

The scrap metal market continues active and further advances in copper and lead have to be noted. This is accounted for by the strength of the copper and lead markets, the latter being particularly active. All varieties of copper scrap are ½c and lead ¾c per pound higher. Scrap zinc and brass are unchanged, but very firm, while iron and steel scrap is dull and stationary. Prices are given in the selected market quotations.

### Machine Tools.

The situation in the machine tool market is unchanged. The difficulty of obtaining anything like satisfactory delivery is the chief trouble that dealers have to contend with. This uncertainty is to some extent affecting the placing of orders. A number of interesting inquiries have been received recently by local dealers, but the amount of business closed this week has not been very heavy on account of the conditions prevailing. The number of firms in the shell business continues to increase and the outlook in the machine tool trade is distinctly promising.

### Supplies.

The demand for machine shop supplies continues good, due almost entirely to the shell business. A number of price changes are to be noted this week. Linseed oil and turpentine have declined 3c and 2c respectively due in both cases to weakness in the market. The sharp advance in pig lead has resulted in higher prices for red lead and lead wool, the former having advanced 2c and the latter 1c per pound.

Brass and bronze wood screws have advanced on account of the increased price of spelter, the new discounts being 75 and 70 per cent. respectively. The new discount on copper rivets is 20 per cent. as against 27 per cent. formerly. The unfavorable conditions in the Manila market and high freight rates have caused an advance of 1c in transmission rope and drilling cables. They are now quoted at 19½c and 17½c per pound respectively.

### Metals.

With the exception of spelter, the markets are showing considerable strength. Tin, copper and lead have all advanced, the latter being very active on heavy demand, while the position of both tin and copper has improved. The spelter market is weak and declining. There has been a good movement in antimony and quotations are strong.

**Tin.**—The market has advanced in London, due to heavy demand with renewed interest in futures. The New York market is quiet, but the spot and June market is strong on account of small stocks and very little to arrive in the next two weeks. Local quotations have advanced 5c and are nominal at 45c per pound.

**Copper.**—Both London and New York markets are strong at advanced quotations. There is a heavy demand for copper and indications point to a further increase in consumption. The copper position is a strong one and higher prices are probable. Copper has advanced ½c per pound locally, and is quoted at 21½c per pound.

**Spelter.**—The market is very weak and a reaction has set in. There appears to be a general desire to sell and take profits, although there are no buyers. The market is probably being manipulated, as the demand continues heavy and supplies scarce. The British Government contemplate commandeering all stocks of spelter in Great Britain, and prohibiting the use of spelter for galvanizing except for government work, including what may be required for munitions. Local quotations have declined 2c, and are nominal at 28c per pound.

**Lead.**—The market continues to show considerable strength with higher quotations. The Trust appears to have control of the market and there is considerable speculation as regards developments. Lead has advanced 1½c locally and is being quoted at 8c per pound.

**Antimony.**—The market is very strong in New York and big business is being done both for future and spot deliveries. Practically the entire production is being used in the manufacture of munitions and the demand is likely to increase. Quotations are very firm and nominal at 40c per pound.

**Aluminum.**—The market is firm and unchanged at 24c per pound.

### ALLIES PURCHASING AGENTS.

**The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:—**

**International Purchasing Commission, India House, Kingsway, London, Eng.**

**British.—Col. A. G. Barton and F. W. Stobart, Ritz Carlton Hotel, Montreal.**

**French.—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendance Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminister, London.**

**Russian.—Messrs. S. Ruperti and Aieksieff, care Military Attache, Russian Embassy, Washington, D.C.**

### CANADIAN EXPORTS to BRITAIN.

THE following are the official figures of trade between Canada and Great Britain in the undermentioned articles during April:

| Imports From Canada. | 1915. | 1914. |
|---|---|---|
| Wheat | £651,467 | £388,132 |
| Wheatmeal and flour | 164,821 | 146,847 |
| Barley | 299 | 19,965 |
| Oats | 23,243 | 4,481 |
| Bacon | 318,745 | 71,225 |
| Hams | 28,355 | 14,666 |
| Cheese | 15,686 | 6,872 |
| Canned salmon | 118,993 | 132,510 |
| Canned lobsters | 12,830 | 4,057 |
| **Exports to Canada.** | | |
| Spirits | 27,213 | 75,626 |
| Wool | 43,795 | 12,464 |
| Pig iron | 6,828 | 4,483 |
| Wrought rails | 558 | 3,152 |
| Galvanized sheets | 4,389 | 55,361 |
| Tinned plates | 6,694 | 6,796 |
| Steel bars | 5,003 | 16,247 |
| Pig lead | 815 | 5,314 |
| Cutlery | 5,330 | 5,364 |
| Hardware | 3,660 | 9,483 |

## Trade Gossip

**Women Make Shells.**—Women are playing an increasingly important part in supplying the huge demands of the British Army for shells. At the Vickers Sons & Maxim Works, Barrow-in-Furness, 600 women hands employed in the manufacture of munitions have given such satisfaction that the firm had decided immediately to employ an additional thousand. Other firms are expected to follow suit.

**Toronto, Ont.**—Hon. G. H. Ferguson, Minister of Lands, Forests and Mines, has decided to offer by tender the disposal of another large pulpwood limit near Lac Seul, north of the Transcontinental Railway. The limit comprises 2,500 square miles. Under the terms of the concession the successful tenderer will be required to construct a pulp and paper mill and spend $1,750,000 on mill and equipment. The capacity of the mill must be 100 tons of paper per day, and it must employ an average of 250 men for ten months in the year.

**The Turbine Equipment Co., Toronto,** has been awarded the following con-

tracts:—One De Laval 2½-million gallon motor-driven pump, for the Brockville, Ont., filtration plant; two De Laval 175 h.p. multi-stage motor-driven centrifugal pumps, each to have a capacity of 1,200 Imperial gallons per minute against 315 ft. total head, including all piping and erection, for the town of Orillia, Ont. These pumps will be direct connected to Canadian Crocker-Wheeler variable speed motors.

**War Contracts Inquiry.**—The inquiry to be conducted by Sir Charles Davidson into army contracts in Canada is to open this week. John Thompson, K.C., of Ottawa, has been selected as Government counsel to assist the commissioner in the probe. Mr. Thompson is a well-known member of the bar and a son of the late Sir John Thompson, former Prime Minister. The sitting to be held this week will be largely of a preliminary character. It is unlikely that further sittings will be held during the summer. In the meantime auditors will examine the records and documents in the department.

**C.M.A. Elects Officers.**—The following officers were elected at the recent annual meeting of the Canadian Manufacturers' Association, held in Toronto: President, K. H. Sherrard, Alaska Feather & Down Co., Montreal; first vice-president, Thos. Cantley, Nova Scotia Steel & Coal Co., New Glasgow; second vice-president, S. R. Parsons, The British American Oil Co., Toronto; treasurer, Geo. Booth, Booth-Coulter Copper & Brass Co., Toronto; auditors, Wilton C. Eddis & Sons, Toronto.

The Government statement is that the "military" (they mean legal) authorities never contemplated having to send away more than six divisions, and now there are six times that number of men abroad. Besides supplying stores and ammunition for this number, we are also supplying a good deal to our Allies, our output being at the rate of 19 to 1 as compared with last September. Recent actions such as Neuve Chapelle show that in attack it is necessary to use shells at a rate never before dreamed of. We should like to hear no more about what our "military" authorities contemplated, because it is clear enough now that their contemplations were entirely and foolishly wrong. All these arguments and comparisons evade the real question, which is—Are we doing all we possibly can to defeat the enemy?—Ex.

**German Torpedoes.**—According to the Rivista Marittima, the German cruisers and restroyers built since 1909 have five torpedoes of 5.50 mm. (21.654 in.) in calibre. They are said to be 5.20 m. (17 ft. 0 13-16 in.) in length, and to carry an explosive charge of 135 kg. (297.5 lb.) of trinitrotoluol.

# CANADIAN COMMERCIAL INTELLIGENCE SERVICE

**The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Comissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.**

## CANADIAN TRADE COMMISSIONERS.

**Argentine Republic.**

H. R. Poussette, 278 Balcarce, Buenos Aires. Cable Address, Canadian.

**Australasia.**

D. H. Ross, Stock Exchange Building, Melbourne, Cable address, Canadian.

**British West Indies.**

E. H. S. Flood, Bridgetown, Barbadoes, agent also for the Bermudas and British Guiana. Cable address, Canadian.

**China.**

J. W. Ross, 6 Kiukiang Road, Shanghai. Cable Address Cancoma.

**Cuba.**

Acting Trade Commissioner, Lonja del Comercio, Apartado 1290, Havana. Cable address, Cantracom.

**France.**

# INDUSTRIAL AND CONSTRUCTION NEWS

**Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.**

## Engineering

**Madoc, Ont.**—P. H. Nayler will equip a machine shop here for making general repairs.

**Picton, Ont.**—The D. J. Barker foundry has been reopened under new management.

**Elmira, Ont.**—A. M. Bowman is in the market for rotary pumps and steam specialties.

**Berlin, Ont.**—The Canadian Consolidated Rubber Co. is in the market for new machinery.

**Windsor, Ont.**—The City Council has authorized the Police Commission to buy a pulmotor.

**Vancouver, B.C.**—The Heaps Engineering Co. are installing machinery for making shells.

**Sarnia, Ont.**—It is reported that the Mueller Mfg. Co. will enlarge their plant in the near future.

**Montreal, Que.**—The Canadian Tar Products Co. will build a boiler house, condenser house and still.

**Aurora, Ont.**—It is reported that three factories at this place will be equipped for making shells.

**Sarnia, Ont.**—Frank Goodwin & Co. has organized a company to manufacture a patent gas heater.

**Milton, Ont.**—It is reported that S. E. Brandon and Gordon Edwards have a contract for making shells.

**Kingston, Ont.**—The council will call tenders for a 300-k.w. alternating current generator. W W. Sands is clerk.

**Chatham, Ont.**—The Canadian Wolverine Co. have decided to rebuild their plant, which was recently destroyed by fire.

**Windsor, Ont.**—The Water Commission will call tenders shortly for a 160-h.p. boiler equipment. W. A. Hanrahan is secretary of the commission.

**Chatham, Ont.**—A movement is on foot to organize a company to rent the Defiance Ironworks and install machinery for making shrapnel shells.

**Calgary, Alta.**—The construction of a series of six dams and power houses is being considered by the Alberta Hydro-Electric Power Co. The consulting engineer is A. W. Ellson Fawkes, and the approximate cost, $2,000,000.

**Montreal, Que.**—Fire on June 9 practically destroyed the plant of the Valleyfield Ironworks Co., on Wellington Street. The damage is estimated at $10,000.

**Picton, Ont.**—Hepburn Bros., of this place, and J. C. Wilson Co., of Glenora, have received contracts for shells. Arrangements are being made to purchase the necessary machinery.

**Cobourg, Ont.**—It is reported that George Thompson, of Thompson & MacDonald, is negotiating with a Toronto syndicate with a view to establishing a plant here for making shells.

**Welland, Ont.**—Extensions have been started at the plant of the Canadian Billings & Spencer Co. The new building will be 80 feet long by 70 feet wide, and the cost is estimated at $30,000.

**Ford, Ont.**—Work on another new addition to the Ford Motor Co. at an estimated cost of $60,000, has been started. The new building will extend 45 feet out into the river and 700 feet parallel with the present factory. Wells & Gray are the architects and contractors.

**Toronto, Ont.**—It is reported that the interests connected with the Chevrolet Motor Co., of New York will in the very near future establish a plant at Toronto. The plant will have a capacity of 15,000 motor cars per annum, and Thomas Houghton has been engaged as production manager.

**Edmonton, Alta.**—Capitalized nominally at $50,000, a company has been incorporated to carry on the business of manufacturing ammunition, explosives and gunpowder in Edmonton. It is stated that the company will take over the contract for $50,000 worth of shells, which was tendered to the Edmonton Iron Works several weeks ago.

## Electrical

**Hamilton, Ont.**—Engineer Sifton recommends that three transformers be purchased, each having a capacity of 1,500 k.w.

**The Halifax Electric Tramway Co.** has just placed an order with the Nova Scotia Car Works for six passenger tram cars for the city service.

**Orillia, Ont.**—The Power, Light and Waterworks Commission has entered into a contract with the Standard Chemical Co., of Longford, to supply the latter with 200 horse-power at a rate of $34 per horse-power per year, for a period of five years. The cost of the necessary pole line, transformers and other equipment is estimated at $11,000.

## Municipal

**Yarmouth, N.S.**—The town council will purchase a quantity of 12-in. cast iron pipe.

**Ingersoll, Ont.**—The council contemplate an expenditure of $10,000 on waterworks improvements.

**Ailsa Craig, Ont.**—The town council propose spending $7,750 on a Hydro-Electric distribution system.

**Preston, Ont.**—A by-law will be voted on by the ratepayers on June 21, to authorize a loan of $25,000 to the Hurlbut Shoe Co.

**Woodstock, N.B.**—The town council are considering the question of improving the water supply. Engineer Barbour, of Boston, Mass., will prepare a report.

**Beauceville, Que.**—The council are considering installing waterworks and lighting systems at an estimated cost of $85,000. J. Mignault, of Sherbrooke, Que., is the engineer.

**Paris, Ont.**—Voting on the by-law to grant $10,000 to Charles E. Wheeler & Son, needle manufacturers, for an extension to their present premises carried almost unanimously, the vote being 302 for and 38 against.

**Owen Sound, Ont.**—The council is considering the advisability of submitting a by-law to the ratepayers to authorize the town to issue $300,000 debentures to cover the cost of constructing a modern concrete elevator of one million bushels capacity.

**Sarnia, Ont.**—In accordance with a petition largely signed by ratepayers of the city, County Judge MacWatt last Monday began an investigation into the building of the new $250,000 waterworks plant, which is located on the lake shore above the city. The plant has so far proved a failure.

## General Industrial

**New Westminster, B.C.**—The Liverpool Canning Co. will build a cannery.

**Toronto, Ont.**—An explosion of an acetylene gas tank on the railway siding did about $2,000 damage to the Gurney Foundry Co.'s building at West Toronto.

**Strathroy, Ont.**—The town council have decided to sell the old Caradoc Street School to George Rivers for a site for a basket factory. Mr. Rivers will commence work on the property at once.

**Madoc, Ont.**—Brown, Robinson & Co., of Toronto, will establish a whitewear factory here. The council will be asked to grant the company a bonus of $2,000.

## Building Notes

**Hamilton, Ont.**—The T. Eaton Co. of Toronto has purchased a site here and will build a factory 75 ft. by 175 ft., and four storeys high.

**Transcona, Man.**—G. G. Teeter, of Winnipeg, has been appointed architect of the Transcona School Board, and the plans which he had prepared for a new school some time ago have been accepted. The new building will cost in the neighborhood of $28,000.

**Toronto, Ont.**—The Advisory Industrial Committee of the Board of Education will receive tenders up to Tuesday, June 22, 1915, for iron fence, to be erected around the grounds of the new Central Technical School, Lippincott Street. Plans and specifications may be seen at the office of the architects, Messrs. Ross & Macdonald, 908 Royal Bank Building.

## Tenders

**Bassano, Alta.**—J. B. R. Bond, town clerk, will receive bids until June 19 for the supply of one 750-gal. turbine waterworks pump.

**Moncton, N.B.**—The I. C. R. is calling tenders for twenty large freight and passenger locomotives, and also a thousand standard steel frame box cars.

**Toronto, Ont.**—Tenders for all trades required for floors, etc., at High Level Pumping Station, will be received up to Tuesday, June 22nd, 1915. Specifications and forms of tender may be obtained at the City Architect's Department, City Hall.

**Stratford, Ont.**—Tenders for a 500,000 Imperial gallon elevated water tower will be received until Friday, June 25, 1915. Copies of the specifications and form of tender can be obtained from F. A. Gaby, chief engineer, Hydro-Electric Power Commission of Ontario.

**Ottawa, Ont.**—Tenders will be received up to July 1, 1915, for the manufacture, supply and erection of a 30-ton steam wharf crane, of the derricking jib type, for Halifax, N.S., dockyard. The specifications and conditions of contract may be seen at the office of the consulting naval engineer, Ottawa.

## Railways—Bridges

**Vancouver, B.C.**—Tenders opened for the rebuilding of Connaught Bridge, which was partly burned a month ago, show that repairs will cost in the neighborhood of $125,000.

**Hamilton, Ont.**—It is understood that the Hamilton Bridge Co. engineers are busy preparing plans for a bridge across the Valley Inn Marsh, to be submitted as a solution of the difficulties facing the Toronto-Hamilton Highway Commission in connection with the new roadway across the marsh.

**Brockville, Ont.**—D. A. Stewart, A. V. Seaborn and A. P. Sturdy, of Ontario Hydro-Electric Commission Radial Railway Department have completed a survey and also secured much information in this vicinity bearing on a proposed electric railway from Toronto to Montreal and Ottawa. The work is practically completed for estimates of cost of construction and possible earning power.

## Personal

**J. W. Eber**, the general manager of the Toronto, Hamilton and Buffalo Railway, has resigned that position because of ill-health.

**Henry Hadley, Jr.**, city engineer of Verdun, Que., has sent his resignation to the council in order that he may qualify for a lieutenancy in the 5th Mounted Rifles.

**M. L. Smith, B.A.Sc.**, of the editorial staff of Canadian Machinery and Manufacturing News, has been appointed Director of Engineering at the new Technical School, Toronto, Ont.

**J. B. Fielding, F.L.S., F.Z.S.**, of Barrie, Ont., has been appointed by the Ontario Provincial Government as Consulting Fisheries Engineer and Fish Culturist. His duties commence at once.

**W. P. Merrick**, Dominion Government Harbor Engineer at Fort William, Ont., for many years, has been transferred at his own request to Windsor, Ont. His successor will be H. P. R. Craig, formerly District Government Engineer at Windsor.

## Wood-Working

**Ayer's Cliff, Ont.**—Charles Robinson has erected a sash and door factory here and will install new machinery.

**Pembroke, Ont.**—Fire has destroyed the Pembroke Lumber Co. sash and door factory. The loss is estimated at $70,000.

**Eburne, B.C.**—The Wilton Shingle Co. mill has been totally destroyed by fire, with a loss of $10,000 on the building and plant.

**Mount Brydges, Ont.** — The Wallace Sawmill Co., whose mill wes recently destroyed by fire, contemplates rebuilding and purchasing new machinery.

**Sherbrooke, Que.**—The Canadian Box Mills Co. are negotiating with the Town Council with regard to the erection of a factory, estimated to cost $15,000.

**Toronto, Ont.**—It is reported that the Pedwell Lumber Co. has recently bought a lot adjoining the Belt Line at Hampstead Park, Fairbank, where they will erect a large factory and elevator, together with a lumber yard for the storage of coal and wood.

## Refrigeration

**St. Boniface, Man.**—Raisig & Co. are contemplating the erection of an abattoir, at an estimated cost of $5,000.

**Estevan, Sask.**—A. Harris, of this town, is interested in a proposed cold storage plant, which will probably cost $20,000.

**Yorkton, Sask.**—The Yorkton Creamery Co. is preparing to erect a larger building and install new, up-to-date machinery.

**Halifax, N.S.**—Heber Hartlen has submitted a proposition to the city to build a modern abattoir. The Board of Health have the matter under consideration.

**Blow-off Valves.**—The Engineering Specialties Co., Toronto, have issued a new catalogue covering the "Everlasting" Blow-off Valve and its services. A copy may be had by writing.

**Charlottetown, P.E.I.**—This city is to have another pork packing establishment in the near future, a company for that purpose now seeking incorporation

TORONTO, ONTARIO

## Knock at our Door with an Inquiry or an Order, and you will find yourself Well Served

Geometric Tools are furnished in many sizes and types for all classes of internal and external thread-cutting, and to suit all makes of Screw Machines.

We make nothing but Thread-Cutting Tools, and thus maintain in them our standard:—"Finest Quality, Greatest Quantity, at Least Outlay."

**THE GEOMETRIC TOOL COMPANY** **NEW HAVEN, CONN., U.S.A.**

**Canadian Agents: Williams & Wilson, Ltd., Montreal. The A. R. Williams Machinery Co., Ltd., Toronto, Winnipeg and St. John, N.B.**

under the name of the Sims Packing Co., with a capitalization of $50,000. The incorporators are Messrs. R. E. Spillet, Samuel Kennedy and Daniel McGregor, all of Charlottetown.

## Contracts Awarded

**Goderich, Ont.**—The Paget Grain Door Co., has obtained an order for 20,000 shell boxes.

## New Incorporations

**The Consolidated Motor Co.**, Vancouver, B.C., has been incorporated with a capital of $25,000, to manufacture motors, etc.

**The Quatsino Copper Co.** has been incorporated at Victoria, B.C., with a capital of $5,000,000, to develop mineral lands at Quatsino, B.C.

**The Northern Electric Co.**, of Montreal, has been granted supplementary letters patent to manufacture shells, ammunition, howitzers and guns of all calibres.

**MacKenzie Brothers, Ltd.**, Winnipeg, Man., has been incorporated with a capital of $100,000, to manufacture iron and steel products. John MacKenzie, W. J. Moran, Gordon MacKenzie are the incorporators.

**The MacLaren Baking Powder Co.** has been incorporated at Ottawa with a capital of $60,000 to manufacture baking powder, etc., at Toronto. Incorporators: Garnet Aikens Archibald and Charles Garfield French.

**The Canadian Laundry Machinery Co.** has been incorporated at Ottawa with a capital of $150,000 to manufacture laundry machinery at Toronto. Incorporators: Frank Adam Gaul and Bidwell Nichols Davis.

**The Tupper Fire Escape Co.** has been incorporated at Ottawa with a capital of $100,000 to manufacture fire escapes and safety appliances of all kinds at Sherbrooke, Que.: Incorporators, William Tupper, Carlos Albert Stokes.

**The Adanac Silver Mines, Limited**, has been incorporated at Toronto with a capital of $2,500,000 to develop mining properties. Head office at Toronto, Ont. Incorporators: John Alexander Donovan and Duncan McArthur, of Toronto.

**The F. R. Wilford & Co.** has been incorporated at Ottawa, with a capital of $50,000, to carry on the business of contractors and machinists at Lindsay, Ont. Incorporators—Frederick R. Wilford and Gerald H. Hopkins, of Lindsay, Ont.

**The Pitts Construction Co.** has been incorporated at Ottawa with a capital of $50,000 to carry on the business of an engineering and construction company at Ottawa. Incorporators: Herman Henry Pitts, Gordon McLead Pitts, of Ottawa, Ont.

**The Cobourg Steel Co.** has been incorporated at Toronto, with a capital stock of $40,000, to manufacture articles from iron, steel, etc. The provisional directors are Robert D. Hume, William J. Elliott, Joseph J. Greenan, all of Toronto, Ont.

**The Cluff Ammunition Co.** has been incorporated at Toronto, with a capital stock of $100,000, to manufacture ammunition, shells, etc. The incorporators are—Arthur W. Holmsted, Arthur B. Mortimer, Henry C. Draper, all of Toronto, Ont.

**The Aetna Chemical Co., of Canada, Ltd.**, has been incorporated at Ottawa with a capital of $1,800,000 to manufacture guncotton, cordite, lyddite, nitroglycerine, etc., at Montreal: Incorporators, Orick Burroughs MacCallum, James Louis Finlay.

**The Walpole Rubber Co. of Canada, Ltd.**, has been incorporated at Ottawa with a capital of $100,000 to manufacture rubber boots and shoes at Montreal, Que. Incorporators: Alexandre Chase-Casgrain, Errol Malcolm McDougall, of Montreal.

**The Burlington Rapid Transit & Motor Mfg. Co., Ltd.**, has been incorporated at Ottawa with a capital of $50,000, to manufacture automobiles, motor cars, motor trucks, etc., at Hamilton, Ont.: Incorporators, Harold James Petrie, Thomas Halford Crerar.

**The Dominion Mines & Quarries, Ltd.**, has been incorporated at Ottawa with a capital of $500,000, to carry on the business of mining, quarrying, concentrating, smelting, etc., at Toronto, Ont.: Incorporators, James Broadbent Taylor, Archibald Woodburn Langmuir.

**The Canada Needle and Fishing Tackle Co.** has been incorporated at Ottawa with a capital of $50,000 to manufacture needles, pins, hooks and eyes, etc. Head office at Toronto, Ont. Incorporators: Ernest Harold Day and Arthur John Crook, of Toronto.

**The Acason Motor Truck Co., Ltd.**, has been incorporated at Toronto with a capital of $40,000 to manufacture all kinds of motor vehicles and accessories. Head office at Walkerville, Ont. Incorporators: Herbert Whalley Acason and Wilson Critzer, of Detroit, Mich.

**The St. Lawrence Machinery, Ltd.**, has been incorporated at Ottawa with a capital of $50,000, to carry on the business of machinists, mechanical and electrical engineers at Montreal, Que. Incorporators—Clarence Francis Smith and Edmund Edwin Cummings, of Montreal.

**The North American Magnesite Co.** has been incorporated at Ottawa with a capital of $200,000 to prospect and refine magnesite, graphite and other minerals. Head office at Montreal, Que. Incorporators: Henry Noel Chauvin, Harold Earle Walker, James McDonald, of Montreal.

## Marine

**Kingston, Ont.**—The steamer Turbinia is in drydock, and will undergo repairs before leaving for trade on the coast.

**Quebec, Que.**—The Department of Public Works, Ottawa, contemplate improving the St. Lawrence dock frontage of the Transcontinental Railway at an estimated cost of $500,000. Secretary, R. C. Desrochers, Ottawa.

**Princess Royal in Commission.**—The C. P. steamer Princess Royal, Capt. Locke, which for the past five months has been out of service in consequence of the accident which befell her in Sabine Channel, has been called into commission again and is now being run on the night service between Victoria and Vancouver.

**St. John's, Nfld.**—The steamship Neptune has been chartered by a New York moving picture concern to make a trip round the world on their behalf. The voyage is expected to last two years. This vessel is amongst the oldest of the wooden members of the sealing fleet, and in her day was very successful, to her credit being due the landing in one trip of the largest number of seals recorded in history. She has also been engaged in a North Pole expedition, as a supply ship.

**Halifax, N.S.**—The stranded Plant Liner A. W. Perry, which went ashore near Chebucto Head on June 8 while on a voyage from Boston to Halifax, slipped off the rock upon which it had been resting and sank in six fathoms of water the following afternoon. Captain Ellis and the crew of the ship, who remained on board after the passengers had been removed, to superintend the attempts to take the ship off, had only left five minutes previous to her disappearance.

1½" Acme Bolt Cutter (Used).
2½" Acme Bolt Cutter (Used).

**Montreal Vessel Torpedoed.**—Cardiff, Wales. — The steamer Morwenna of Montreal was torpedoed, shelled and sunk by a German submarine at midday of Wednesday, May 26, at a point 160 miles west by south of St. Anne's Head. One member of the crew of the vessel was killed, while three others were injured. The survivors were landed at Cardiff, Wales. The Morwenna was bound from Cardiff for Sydney, Cape Breton, in ballast. The Belgian trawler Jacqueline picked up the crew. The Morwenna was a steel steamer of 1,414 tons gross, owned by the St. Lawrence Shipping Co., and under British registry from the port of Montreal. She was built in 1904 at Dundee, Scotland.

**British Merchant-Ship Building.**—The diminution in the amount of merchant ship work actually proceeding in British shipbuilding yards continues, and indeed a stage has now been reached when it is hardly an exaggeration to say that the construction of mercantile vessels has almost ceased there, notwithstanding the obvious need, referred to recently by the Chancellor of the Exchequer, of maintaining the mercantile fleet for the purpose of carrying overseas the national supplies of foodstuffs and raw materials. Naturally, such an extraordinary state of affairs cannot long continue, but at the present moment so pressing is the need for all energies to be concentrated on the building and completion of war and subsidiary vessels for the Government, the claims of all other classes of work in the shipyards are receiving but scant attention.

**New Dock Opening.**—In the presence of nearly 2,000 persons, among them three hundred members of the Board of Trade, the new Government dock at the foot of Church street, Windsor, Ont., the construction of which was commenced last year, was formally placed in service on May 27. It was expected that Hon. Mr. Hazen, Minister of Marine and Fisheries, would have been present to officiate at the ceremonies, but owing to illness he was unable to come, and Oliver J. Wilcox, M.P., took his place. At the luncheon served under the auspices of the Board of Trade, addresses were made by Mr. Wilcox, W. C. Kennedy; Dr. J. O. Reaume, Collector of Customs; Dr. J. A. Smith, and others. The new dock, which is the best appointed along the Detroit River, cost $65,000, and was built entirely under the supervision of Lieut.-Col. H. J. Lamb of the Public Works Department. It is of concrete throughout, is 655 feet in length and can accommodate the largest boats on the Great Lakes. Upon it is erected a large warehouse of fireproof construction, 300 feet long, with offices for the officials. The river has been dredged to give twenty feet of water at the dock. Jas. A. Reid has been appointed as custodian of the dock and he will assume his duties at once.

# Trade Gossip

**Quebec, Que.**—It is announced that the properties of the Dorchester Electric Co. will be sold by auction on June 30.

**The B. & S. H. Thompson Co.** have removed their Montreal office from the Transportation Building to the McGill Building.

**Vancouver, B.C.**—The Sabulite Company of Canada, Ltd., has received large orders for bombs and grenades for the British Government.

**The Canada Grip-Nut Co.** have removed their Montreal offices from the Eastern Townships Bank Building to the McGill Building, McGill Street.

**St. John, N.B.**—A syndicate of Toronto capitalists has taken over manganese rights in Jordan Mountain district, and will have the same explored this summer. The Markhamville manganese areas are also to be developed at any early date.

**Students to Work on Shell Tools.**—The applied science department of McGill University, Montreal, has turned over its mechanical equipment for the manufacture of shell tools, and every student of this department has promised to devote his time exclusively to the work. It is expected that other Canadian universities will follow McGill's example.

**Toronto, Ont.**—The Turbine Equipment Co. have made a claim on the city for $2,080 as war tax on a pump for the main pumping station. They assert that it was owing to the city that the pump was not delivered before the war tax was imposed. The Works Commissioner reported that the city is liable for the amount, but the Mayor stated that he did not agree with the Commissioner's opinion.

**Big Copper Exports.**—Thus far in 1915 American exports of copper to Europe have been approximately 120,000 tons, against 180,000 tons in the corresponding five months of 1914, when the world was at peace and industry in Europe was flourishing. In spite of the contrast between conditions ruling now and then, Europe is buying copper at a rate equal to 70 per cent. of its 1914 purchases, and is steadily bidding for more of the metal. That is why copper stocks are so strong.

**Calgary, Alta.**—One of the largest industrial mergers of recent years in the West was consummated on June 10, with the merging of the Western Foundry and Metal Co., Ltd., and the Canadian Equipment and Supply Co., both of Calgary, and the International Supply Co., Ltd., of Medicine Hat, into the Canadian Western Foundry and Supply Co., Ltd., capitalized at $1,000,000, with head offices in this city.

## Catalogues

**Arc Welding Apparatus** is the subject of Bulletin No. 48,905 being distributed by the Canadian General Electric Co., Toronto, Ont. The bulletin, which describes fully both stationary and portable outfits relative to construction and operation, is fully illustrated, and includes diagrams, with a table giving the principal dimensions.

**The Dwight Slate Marking Machine** is the feature in a catalogue being distributed by the Noble & Westbrook Mfg. Co., Hartford, Conn. Other matter deals with steel die cutting and dies, while a few samples of engraved work are also given, showing the wide scope of this machine. The catalogue concludes with a list of concerns using these machines.

**Automatic Starters** for alternating current motors are dealt with in Bulletin No. 48,405 being distributed by the Canadian General Electric Co., Toronto. Various types of automatic starters to suit the wide application of alternating current motors for industrial work are illustrated and described. A number of dimensioned diagrams and tables of automatic compensators, self-starters and float switches are also included.

**Economy Cold Sawing** is the title of a new catalogue dealing with the Lea-Simplex cold cutting-off saws, made by the Earle Gear & Machine Co., Philadelphia, Pa. The principal features of these saws are explained and details of construction described fully, accompanied by a number of very clear illustrations and diagrams. Specifications are included covering the various sizes, according to capacity. The catalogue concludes with a list of users of "Lea-Simplex" saws.

**Monarch Furnaces.**—A catalogue being distributed by the Monarch Engineering & Mfg. Co., Baltimore, Mo., features at length several types of furnace for mines, smelters, refiners, etc. Among those described are the double chamber, tilting, non-tilting and pit furnaces. Other descriptive matter deals with muffle furnaces, cyanide ovens, blowers, fuel oil burners, etc. A number of tables give the principal sizes and

general information covering the various types, all of which are illustrated.

**Riveters.**—Catalogue No. 3, fifth edition, 1915, deals with the various types of riveters made by the Hanna Engineering Works, Chicago, Ill. The principal features of the Hanna riveter are treated in detail, accompanied by illustrations and diagrams showing the construction and mechanical actions. The various types are illustrated, and, in addition, are included a series of interesting sectional drawings with the name of each part given. A number of tables give a list of sizes and code words, this being followed by a list of users. The concluding pages contain illustrations of various types of foundry equipment.

## Book Reviews

**The Progress of Warship Engineering,** by C. de Grave Sells, M.I.C.E., is the title of a reprint from Janes' Fighting Ships, 1914, published by Sampson Low, Marston & Co., London, England. Price 2/6, 60c net. This is a most interesting publication and the accuracy of the information contained in its pages is unquestioned, having in mind the reputation of the author. The opening pages contain a description of the "Demologos," the first warship propelled by steam, and designed by Robert Fulton. The development during succeeding years is not touched upon until the advent of modern machinery, such as water-tube boilers, steam turbines, etc. In this section are described various types of steam turbines for war vessels with sectional views showing the general construction and details. This is followed by a description of several types of water-tube boilers, explaining their development and reasons for certain distinctive features embodied in their construction. Boiler economy and efficiency is next dealt with and includes descriptions of such apparatus as gas analysers, efficiency meters, calorimeters and recording instruments, etc. Considerable space is devoted to fuel oil and to the development of Diesel engines, while similar treatment is accorded air compressors and refrigeration plants. Other subjects dealt with include corrosion of boiler tubes, warship ventilation, ash dischargers, transmitters, etc. The booklet is carefully written and fully illustrated. It is both interesting and instructive, as it explains the progress that has been made during recent years in the propelling machinery and boiler plants of warships.

**Stop That Waste of Water**

Did you ever stop to think how many gallons of water are wasted by the old-fashioned drinking faucet?
Puro saves 35% of that wasted water.
Puro does away with the old-fashioned unsanitary tin-cup; it is the Safety Sign of pure water in every factory where it has been installed.
Employees like it because it is clean—because it insures a clean, fresh drink—because it saves their time.
The Puro Sanitary Drinking Fountain has a positive control that eliminates spurting.
Easily attached—positively fool-proof—and nothing to wear out.
An excellent investment—for shop and office alike—and one that pays dividends in real money on water saving and better workers.
Write to-day—now—tell us how many men you have and the number of departments.
We'll make you a complete estimate on an installation—we will also make you a special proposition for a try-out in any one department.

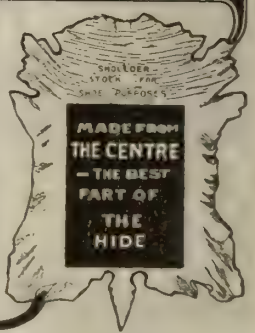
# J.C.McLAREN BELTING

J.C. McLAREN BELTING CO. OAK EXTRA TANNED EST 1856

**Will Save You Money In Every Day of Service**



Modern plant and thorough knowledge of requirements of belting guarantees perfect satisfaction to all buyers. Our belts are the result of using best leather, and our 57 year's experience.

**Ask for Quotations.**

**J. C. McLAREN BELTING CO.**
Limited
Montreal Toronto Winnipeg

**20 TIMES THE SERVICE**

That's what this self-hardening, high-speed steel chaser does for the LANDIS DIE.

Four long cutters tangentially disposed to the work carried in suitable holders make an ideal cutting condition. This, along with its many other distinctive characteristics, has established for us a world-wide reputation.

WRITE FOR CATALOGUE NO. 21.

**Landis Machine Co., Waynesboro, Pa.**
Exclusive Canadian Representatives,
Williams & Wilson, Montreal, Canada.

**PRESSES—ALL TYPES**

Press Attachments, Automatic.
Metal and Wire Forming Machines.
Tumblers—Large Line.
Burnishing Machines. Grinders.
Special Machines.

**Baird Machine Co., Bridgeport, Conn.**

**Detective and Stop Watch Combined.**

"We have a counter on every one of our presses, even the foot presses." This from a satisfied user of our counters. If you use presses our counters would save you money. **Ask for catalog 25.**

**The C. J. ROOT CO., 125 Bridge Street, Bristol, Conn.**

## Genuine Armstrong Stocks and Dies

**Hinged Pipe Vises.**
**Pipe Cutters. Steam and Gas Fitters' Tools.**
**Pipe Machines for Threading Pipe.**
**Either Hand or Power.**

*Manufactured by*

**THE ARMSTRONG M'F'G CO.**
328 KNOWLTON ST. BRIDGEPORT, CONN.
NEW YORK, 248 CANAL ST.

# NORTON JACKS

**For all kinds of heavy lifting**

Send for complete catalogue showing 50 styles 10 to 100 tons capacity.

Made only by

**A. O. NORTON, LIMITED**
Coaticook, Prov. Quebec - - Canada

# The Garvin Machine Co.

**Manufacturers of**

Milling Machines; Profiling Machines; Cam Cutting Machines; Screw Machines; Monitor Lathes; Die Slotting Machines; Screw Slotters; Tapping Machines; Duplex Horizontal Drills; Gang Drill Presses; Four-Head Right-Angle Drills; Wrenchless Chucks; Spring Coilers; Cutter Grinding Machines; Surface Grinders; Hole Grinders; Hand Lathes and Special Machinery.

**We Want All To Have Our Catalog—Send For It To-day.**

**Spring and Varick Streets, NEW YORK CITY**

$\frac{1}{16}$ Page $1.60 per insertion on yearly order.

# CANADIAN MACHINERY BUYERS' DIRECTORY

TO OUR READERS—Use this directory when seeking to buy any machinery or power equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A rate of $5 per line a year is charged non-advertisers.

# HOSKINS

TRADE MARK REGISTERED

PORTABLE TYPE

Reduced Size View of Thermo-Couple Welded End

## New Type Pyrometer Now Ready for Shipment

The HOSKINS improved Pyrometer will operate on continuous service 600 degrees Fahrenheit higher than recommended for any other type of base metal pyrometer.

The new alloy is made in an electric furnace, is absolutely free from impurities, and has a very great resistance to oxidization.

The new type thermo-couples have a **GUARANTEED LIFE.** If a HOSKINS thermo-couple burns out within three months it will be repaired free of charge.

Let us know your furnace arrangement and we will suggest an equipment.

Used by 75% of the manufacturers of Shrapnel Shells in Canada.

Stewart Gas and Oil Furnaces.

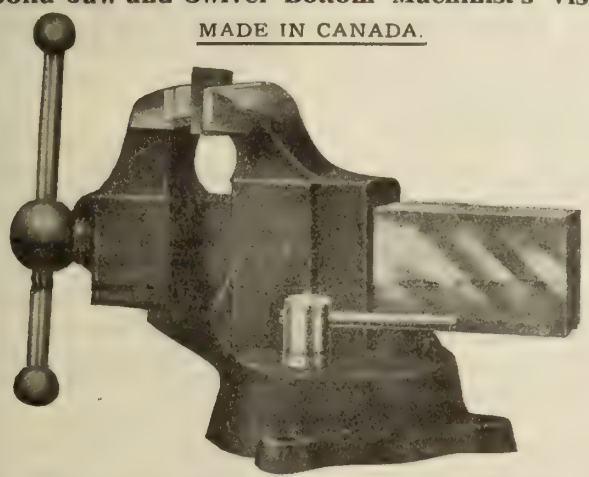
Electric-Furnaces, Pyrometers and Heating Appliances

WALKERVILLE, ONTARIO

# The YOST

## Solid Jaw and Swivel Bottom Machinist's Vise

MADE IN CANADA.



A vise with a grip like grim death; a durability that defies time and the hardest usage.

A vise that will give you a lifetime of perfect service and satis.action. The metal in a Yost Vise is of faultless quality, perfectly distributed and the workmanship is

***Incomparably Good***

The National catalog would certainly interest you. Write us, asking for a copy.

**National Machinery & Supply Co., Ltd.**

HAMILTON - - ONTARIO

**This Guarantee Goes With Every Vise:** We fully guarantee all of our Vises to be satisfactory in every particular and will promptly replace, without cost, any parts broken or badly worn when such failures are due to faulty material or construction.

## 16 in. Lever POST DRILL

### A Giant Little Machine For Light Drilling.

### Will drill up to 7/8 inch.

The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

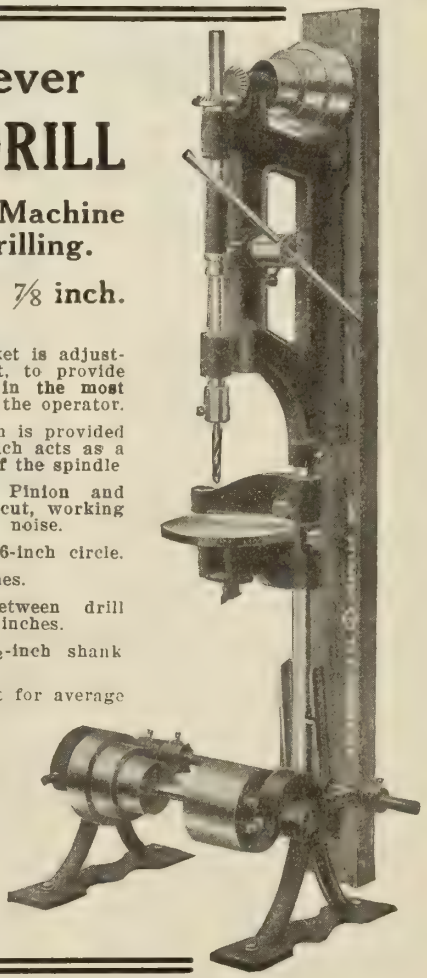
Drills to centre of 16-inch circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 23 inches.

Spindle bored for ½-inch shank twist drills.

Speed of countershaft for average work, 300 per minute.



**A. B. Jardine & Co.**

Hespeler, Ontario

You Wouldn't Run Your Auto Till It Fell Apart

You try to keep your car at its *highest* efficiency. When a part becomes worn, you replace it promptly. You don't wait for it to fall apart.

Then Why Let Your Men Use Files Till They're Completely Worn Out?

At a certain point in its life on *any* work, a File's *best* efficiency is lost. Beyond that point, it's like a car with a cracked cylinder or broken valve.

Its reduced efficiency means a *loss*. In time—in money—or in both.

For the sake of *better profits*, enforce the rule among your men that all worn files must be discarded promptly, and replaced with the "Famous Five":

KEARNEY & FOOT
GREAT WESTERN
AMERICAN
ARCADE
GLOBE

*(Made in Canada)*

They are the finished product of 50 years' experience—in producing 60,000,000 files per year. In our five great plants—we control every process from steel to file. That means absolutely uniform file-service—year in, year out. And the fact that we supply 90 per cent. of Canada's file requirements, proves that the "Famous Five" (used right) *cut down file costs.*

Write to-day for FREE copy of "File Filosophy" and our Catalog. Over 4,000 different patterns —the RIGHT file for every need.

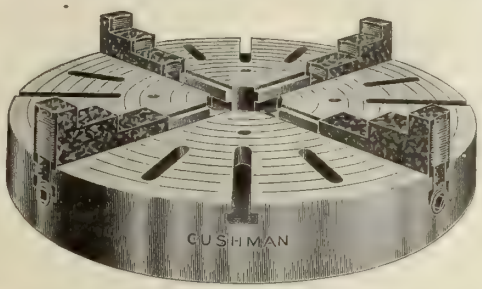
# Cushman Chucks



When you buy a "Cushman" Chuck you are absolutely sure of getting one having strength, accuracy and durability. Being specialists in these goods we are able to furnish Chucks of quality at a very moderate price.

Our line of styles and sizes is very complete—

**Lathe Chucks, Drill Chucks, Centering Chucks, Portable Face Plate Jaws**

Our regular chucks are known as the heavy pattern, but we now have a new line called "Blue Line" Chucks, made entirely of steel.

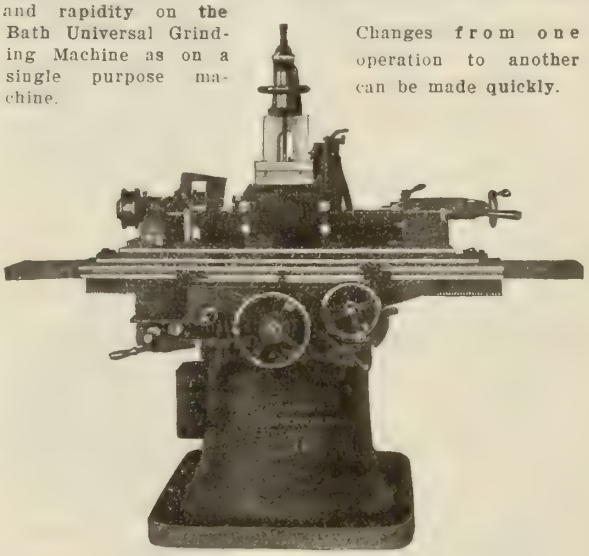
**Let us send you our catalog.**

**The Cushman Chuck Co.**
**Hartford, Conn., U.S.A.**

# Here's a Grinder that Never Needs Be Idle

Because of its greater range of work—External and Internal, Cylindrical, Surface, Disc, Cutter and Reamer Work of all description can be ground with as much accuracy and rapidity on the Bath Universal Grinding Machine as on a single purpose machine.

Changes from one operation to another can be made quickly.



WRITE FOR DETAILS

**BATH GRINDER COMPANY**
**FITCHBURG, MASS.**

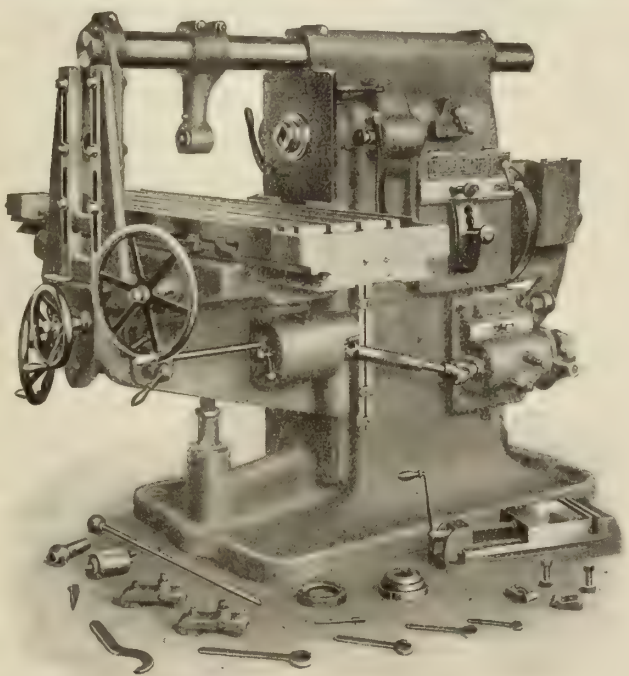
# You Need This Machine If These Are Your Requirements

## A Rugged Machine For Heavy Service

The type of machine that creates a feeling of confidence in its ability to handle work right. Doesn't the massive appearance of the frame, the wide base and long knee slide, the rigid arm braces, the liberal proportions of table, saddle and knee indicate fitness for heavy service?

## A Handy Machine For Quick Operation

For economy in production you must have handiness. The feed and speed change mechanisms are simple, easy of access, and quickly operated, which saves time in setting up and running. As you can see from the cut, the levers and handwheels are conveniently placed so they can be used without wasted motions.



No. 5-B Heavy Plain Milling Machine Feeds—50 in. x 12 in. x 21 in.

## A Powerful Machine For Good Production

That's an important requirement, but it is met with a margin to spare. The large amount of power for heavy cuts is amply supplied by a 7" belt driving a 20" pulley at 320 R.P.M. Naturally there is heavy belt pull, but a massive support both sides of the pulley take care of this.

## A Well-Built Machine For Continued Service

How long will it stay efficient? On the answer depends the wisdom of the investment. With well-proportioned parts of high-grade material, thoroughly finished and carefully aligned, B. & S. Milling Machines are designed throughout to be a safe and profitable investment for efficiency and economy. The line includes 38 styles and sizes of milling machines.

# FOR EVERY LIFTING NEED

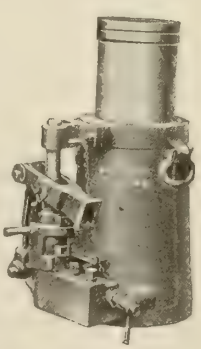
THERE IS A

# Watson-Stillman Hydraulic Jack

**The Watson-Stillman Independent Pump Hydraulic Jack** for use where it is inconvenient to work the lever of a jack, or in any cramped position. The pump may be placed eight feet from the load, thereby insuring convenience and safety to the workman. These are built in capacities from 10 to 500 tons, and lifts from 4 to 30½ inches.

**The Watson-Stillman Plain Hydraulic Jack** for use when a firm rest or footing can be had. It is built in capacities from 4 to 60 tons, and movements of 9 to 24 inches.

**The Watson-Stillman Wrecking Hydraulic Jack** is built to meet the demands of a complete wrecking tool. Its construction is such that it can be used in either vertical or horizontal position. A removable claw can be furnished to allow heavy lifting close to the ground. It is built entirely of steel in capacities of 15 to 60 tons. 9 to 18 in. lift.



**The Watson-Stillman Outside Hydraulic Jack** is built either vertical, horizontal or of the reversed type. The unusual features of these jacks are the simplicity of design, accessibility of working parts and large bases. Compactness is not attained at the expense of strength; **they are made to work.** These are built in 60 to 200 tons capacities, and 9 to 18 in. lift.

**Write for our catalog No. 91, and get further details of the jack you need.**

# Go to Chicago With Your Ad Man

**Attend with him the big Convention of Associated Advertising Clubs of the World, June 20 to 24, 1915.**

You will assimilate more knowledge of modern methods of Advertising, Selling, Distribution, and Management during these five days than could be obtained in a life-time of book study.

You will be brought in touch with the men who have done and are now doing the big things of business. You will participate in the biggest business meeting the world has ever known. You will listen to the expressed thoughts of distinguished Americans concerning present day and future business movements.

You will enjoy Chicago's wonderful park system, boat rides on Lake Michigan, modern hotels, theatres, and other amusements, including the big street pageant, and the Gridiron Show given at the Auditorium Theatre by 150 Chicago Advertising men.

*Distinguished Speakers.* President Wilson, State conditions permitting, will head the notable array of speakers. Hon. William Jennings Bryan, George Horace Lorimer, Arthur Brisbane, John H. Fahey and Henry Watterson are among the others who will be heard.

**Advertisers in and publishers of trade and technical journals will hold special Departmental meetings to discuss their own problems and learn how they can co-operate to better advantage. Other departmental meetings will take up such subjects as catalogues, engraving, printing, mailing lists, sales plans and kindred subjects.**

*The ladies* are wanted too. Special entertainment—teas, luncheons, automobile trips, etc.—is being arranged for them by Mrs. Chas. H. Porter and her committee.

Clear up your desk. Take a five days' vacation in a lake-cooled city. Mix with the business builders. You will return a better business man; a better physical man; and a better thinking man.

**For further information, programme, rates, etc., address Convention Bureau, Advertising Building, Chicago, Ill.**

**CANADIAN MACHINERY, 143-153 University Ave., Toronto**
**Montreal Winnipeg Boston New York Chicago London, Eng.**

# CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS--Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.
TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.
TO NON-ADVERTISERS—A nominal rate of $5.00 per line a year is charged to non-advertisers.

The "HENDEY" Lathe

# The Service

## Capacity and Convenience

of a Hendey Lathe will prove of vital importance to your tool room.

The **"Hendey"** is accurate in the highest degree and **suited for the efficient use of watch tool chucks, stop chucks, relieving attachments, etc.**

It has the best spindle construction in its taper journals, with annular bearings and automatic oiling rings, which make for accuracy of alignment.

It has **automatic stop** for carriage working in either direction. Has reverse for carriage, controlled from apron.

Wide range of threads and feeds through mounted gearing, with ability to make gear changes for additional threads and feeds without limit.

**A card will get you full particulars. Why not mail it now?**

# Starrett Tools

Every good toolmaker and machinist accepts Starrett Tools as the standard for accuracy because they are always perfectly reliable and are designed for convenience and efficiency.

## Surface Gages

This line includes five styles of surface gages. The most complete type is the Universal Surface Gage No. 257 shown here; sizes 9″, 12″, and 18″ spindles. Prices $3.00 to $4.00.

## Protractors

The protractor shown here is the Universal bevel protractor No. 362 with vernier for use by toolmakers and machinists in measuring and laying out angles. Sizes 7″ to 12″. Prices $8.00 to $11.75, depending on attachments.

## Test Indicator

The segment test indicator No. 64 shown here is useful for testing of work in the lathe, for turning, chucking, or locating on face plate. It may also be used on jig work and other bench jobs in connection with any of our surface gages. Price complete $3.50.

## Send for Catalog

**If you are interested in the purchase of fine tools, send for free copy of catalog No. 203, giving prices of 2100 styles and sizes.**

# The Tap with the Con-eccentric Land

## For Tapping Nuts

**One-third of the land from the cutting edge is concentric. The remaining two-thirds has eccentric relief.**

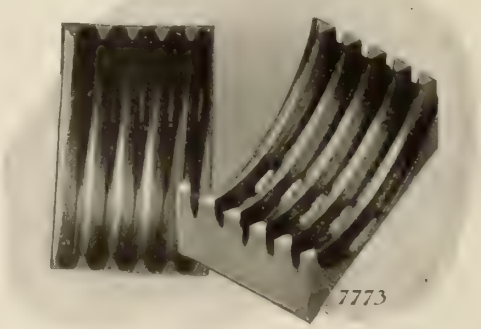
TO show more clearly the free-cutting qualities of these taps, a nut slightly smaller than one and one-quarter inches square was drilled for tapping and held lightly by the corners. The nut was then tapped with a 1¼-7 U.S.S. con-eccentric tap, driven through without reversing. (See cut on right).

So perfect were the cutting qualities and so easily and freely was the work done that this mere shell of a nut was *not even distorted,* to say nothing of being split as would have happened with a tap differently constructed.

Consider what this means to the nut manufacturer from the standpoint of a *saving in power.* This is but one reason why Pratt & Whitney taps are specified by the largest nut manufacturers in the country.

For a number of years we have made taps with this style of relief. They have won out steadily and consistently on merit alone.

**Write for our Booklet "The Tap with the Con-eccentric Land."**



TAPS can be sharpened at the only correct point — on the face of the cutting edge.

Sharpening in no way affects their size.

Can be sharpened long after other so-called eccentrically-relieved taps are rendered useless.

We obtain the freest cutting tap with the longest life—an exclusive combination.

Accuracy nowhere else obtainable is secured together with a degree of finish and refinement heretofore thought impossible in a commercial tool.

We want tap users to know *why Pratt & Whitney taps are best,* also that our claims are based on reasons mechanically correct.

Cut to left is a tapped nut sawed in half showing small area of metal which held it together.

The taps are carried in stock by our Branch Offices and Agencies throughout the world. Prompt service assured to all customers wherever located.

## Announcement!

Next week's Canadian Machinery, like our issue of April 29th, will be devoted to the manufacture of High Explosive and Shrapnel Shells.

From an editorial standpoint it will be unusually interesting and its advertising pages will constitute an extremely valuable directory of shell-making equipment.

Subscribers desiring extra copies of this important number should send in their request immediately.

Manufacturers desiring to participate in this splendid opportunity should reserve their space by telephone or telegraph, and send copy and cuts forward so as to reach us not later than June 28th.

CANADIAN MACHINERY
143 UNIVERSITY AVENUE :: TORONTO, ONTARIO

When ordering machines for special work, select those which will be useful for general work after the special necessity ceases—for example, the

## Universal Hollow-Hexagon Turret Lathes

They are rapid, powerful and rigid—extremely accurate and highly economical in the production of duplicate parts in large quantities. And they are so adaptable as to be profitable where only a few parts of a kind are to be machined. Write for circular.

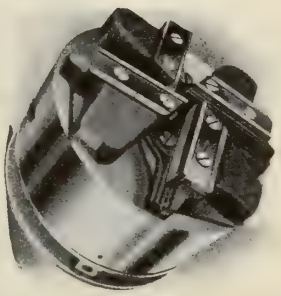
## In Scientific Selection The Landis Die Predominates



Because,—

The length of the chasers increases its life from ten to twenty times that of the hobbed die.

The line contact the chasers have with the work minimizes the friction at the cutting edges and permits of a much higher cutting speed.

Of the interchangeability of the chasers, which means any one or more of a set can be replaced without renewing the entire die.

Of the right and left hand threading with the same set of dies, a feature accomplished by grinding the opposite ends of the chasers and using right and left hand chaser holders.

Of the uniform hardness of the chasers, which makes it unnecessary to anneal, hob or retemper the die.

Here is a machine that is well worthy of your attention—our **"Double C Punch and Shear"** with 48-inch throat.

This machine has an enormous capacity for doing **rapid, accurate** and **economical** work of **quality**.

Let us send full description. If you are interested in up-to-date money-saving machinery you cannot afford to remain uninformed.

We manufacture a complete line of

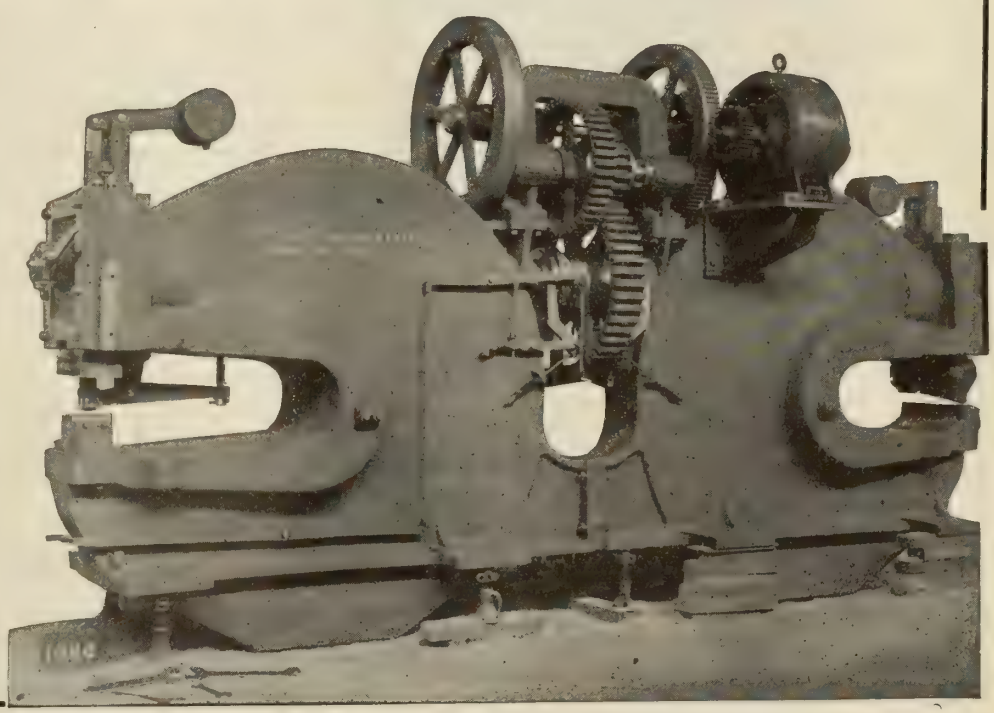
**LABOR-SAVING MACHINERY**

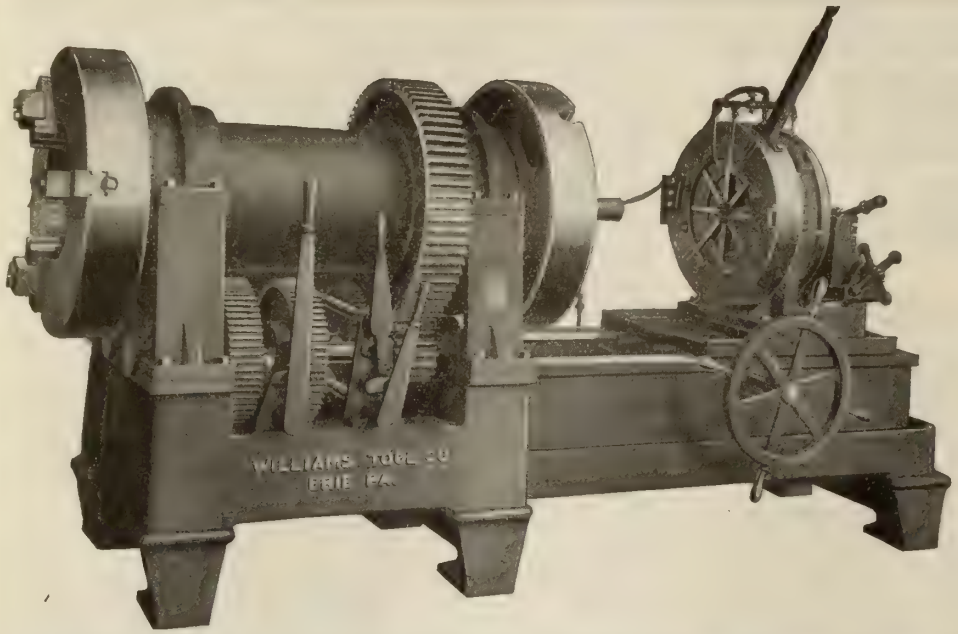
all kinds and sizes, for

**Structural Iron Works, Railroad and Locomotive Shops, Boiler Shops, Rolling Mills, Agricultural Implement and Plow Shops, etc.**

**The Long & Allstatter Co.**
**HAMILTON, OHIO**

Canadian Representatives
RUDEL-BELNAP CO.
Montreal, P.Q. Toronto, Ont.





The gas light was a big improvement over the tallow dip, but it had to give way to the electric light; and the Tungsten has superseded the little glimmer that once delighted us.

If you are still employing pipe-cutting methods as antiquated as the tallow dip, you need a Williams Pipe Machine, which occupies the same position in the pipe-cutting field as the Tungsten does in the lighting world, to bring you up-to-date.

*Let us quote you prices and terms: any machine to cut 10 sizes of pipe between 1-4 inch and 18 inch, with any kind of power.*

**Anyone making, selling or buying a pipe machine, claimed to be a Canadian-made Williams Pipe Machine, does so without right or authority from us, and is liable to prosecution for damages.**

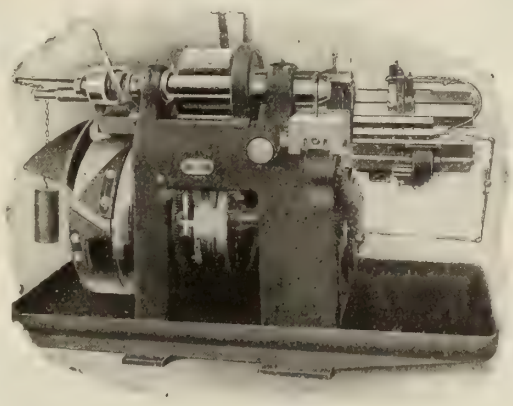
"GRIDLEY" Single SPINDLE



## —*no overhang of tool on*
# Gridley Automatics

On all other Automatics there is an overhang of the tool. This overhang prevents the performance of accurate work, because the method of supporting tools doesn't permit as **heavy cuts or as coarse feeds.**

Besides being free from overhang, Gridley Automatics are free from many small parts which make others so complicated, and they handle a **wider range of work.**

You can change the tools on a "Gridley" as quickly as you can on a hand machine.

**The idle movements are always at constant speed**—much faster than others—which helps toward a faster production.

**One man can operate from 3 to 6 machines at once,** and can use tools tandem when rapid production is necessary, hence a saving of labor.

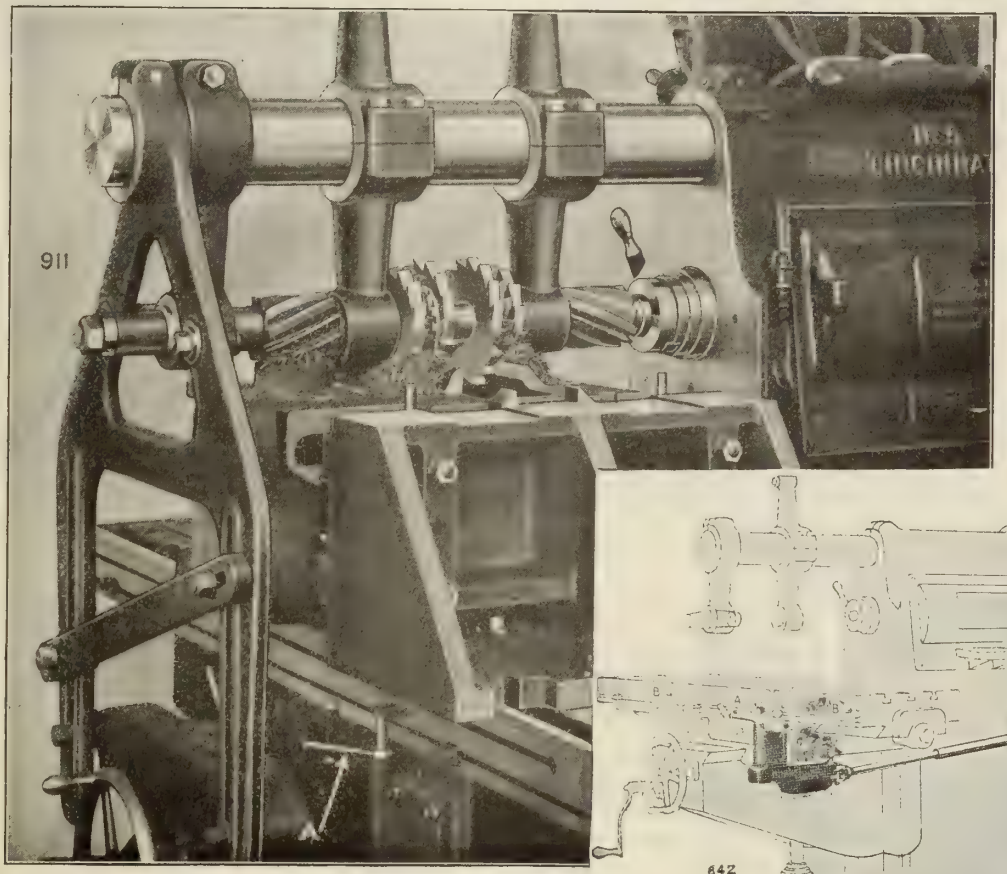
**Let us put all the Gridley distinctive features before you—drop a line for catalog.**

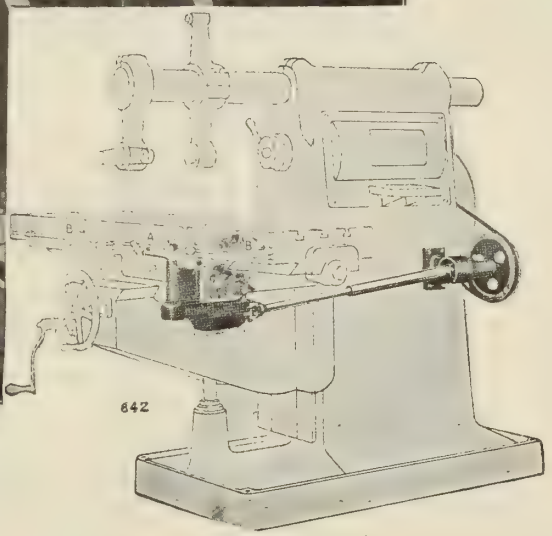
# Windsor Machine Co., Windsor, Vt., U. S. A.

**Canadian Office, 1501 Royal Bank Building, Toronto**

**E. C. Roelofson, Manager.**

# No More Tired Backs!





**Cincinnati, No. 4 Plain, High Power**

Material: Close Gray Iron.
Largest cutter: 8″ diameter.
25 r.p.m.
6⅛″ feed.
6½″ width of cut, ¼″ to 5-16″ stock removed.
Time per piece floor to floor, 10 min.

The lever A operates the Power Quick Traverse. It is available when the machine is shut down. Think of it! A Quick Traverse that can be used when setting up the machine.

## The "Cincinnati" Power Quick Table Traverse

greatly increases the already large production of Cincinnati High Power Millers by reducing the non-productive operating time.

The "Cincinnati" operator is relieved from the strain and time-consuming labor of moving this heavy table by hand when *setting up* or *returning after the cut* is finished.

The "Cincinnati" Power Quick Traverse Mechanism is entirely separate from the feed mechanism, thus acting on the longitudinal feed only.

Interlocking levers prevent engagement of quick traverse when regular feed is engaged.

Simplest possible operation. Direction of lever "A" indicates direction of table movement. Operation independent of all other reverses.

Reasonable power movement of 100″ per minute permits the operator to bring work directly to the cutter without fear.

This is only one of the many productive features of Cincinnati High Power Millers. They are all worth your investigation. Catalogue describes them.

# Starrett Tools

## Gages

In addition to our regular lines of machinists' tools and instruments, we make a number of standard gages which are of great assistance to the machinist and toolmaker. The gage shown here is a drill, tap and wire gage which gives standard sizes of drill and their corresponding taps, together with decimal equivalents, etc. We make other gages, such as our screw pitch gages, thickness gages or feelers, wire gages, etc.

**Send for free catalog No. 203 to aid you in selecting tools and gages. It gives prices and illustrations of 2100 styles and sizes of tools and hack saws.**

# Williams' "AGRIPPA" Tool Holders

## Are The Proof Of Progress

All our Tool-Holders Positively Guaranteed.

Money Refunded within 90 days if unsatisfactory.

**TURNING-TOOL HOLDERS**

Cam lock.
Rapid and positive.
The greater the pressure, the tighter the lock.
No set-screws to strip or upset.
No holders to scrap.

**CUTTING-OFF & SIDE-TOOL HOLDERS.**

Cam lock.
Rapid and positive.
The greater the pressure, the tighter the lock.
Interchangeable blades.
One holder for both cutting-off and side-tool work.

**BORING-TOOL HOLDERS**

Take multiple bars of all commercial shapes.
No bushings required.

**SLEEVE BAR**

Universal cap for straight or angle cutter.
No loose or extra parts.

**PLAIN BAR**

Simplicity itself—a solid bar.

**THREADING-TOOL HOLDERS**

Combination rigid and spring tool for rough or finishing cuts.
Lockable spring head.
Equally efficient for turning-tool work.
Alloy steel cutters.
Cam lock.

**PLANING-TOOL HOLDERS**

36 angles of adjustment—note serrations in the adjustment ring.
Perfect seating of cutters.
Uniform locking pressure.
Adjustment ring takes the strain, relieving holder of wear.
Excellent also for offset turning-tool work.

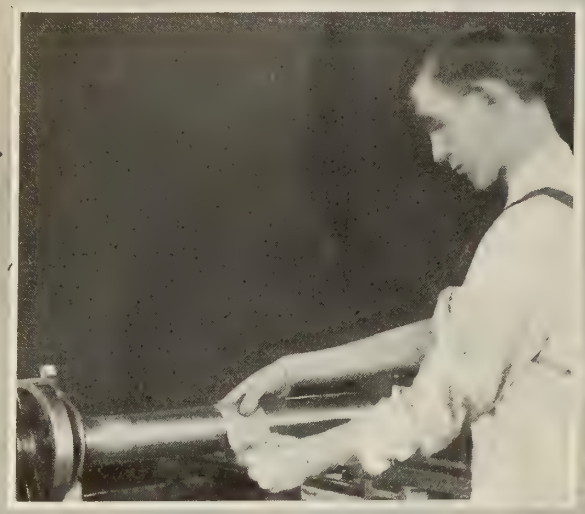
## There is a cloth that cuts—cuts almost like a grinding wheel—it is

# Aloxite Cloth

**The Cloth with the Brown Backing**

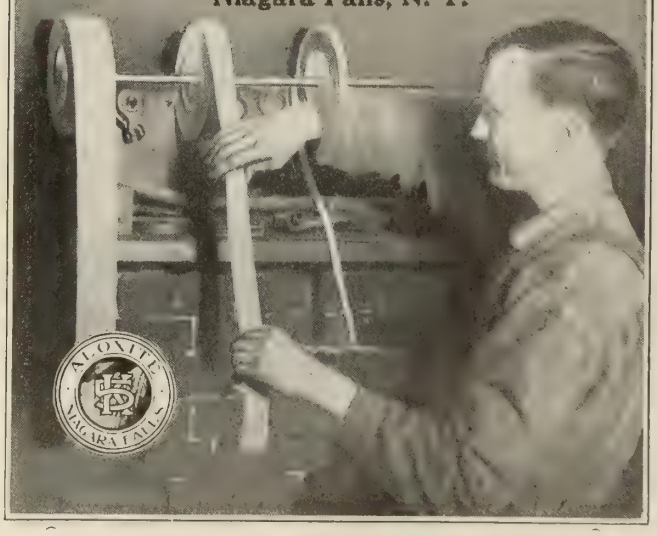


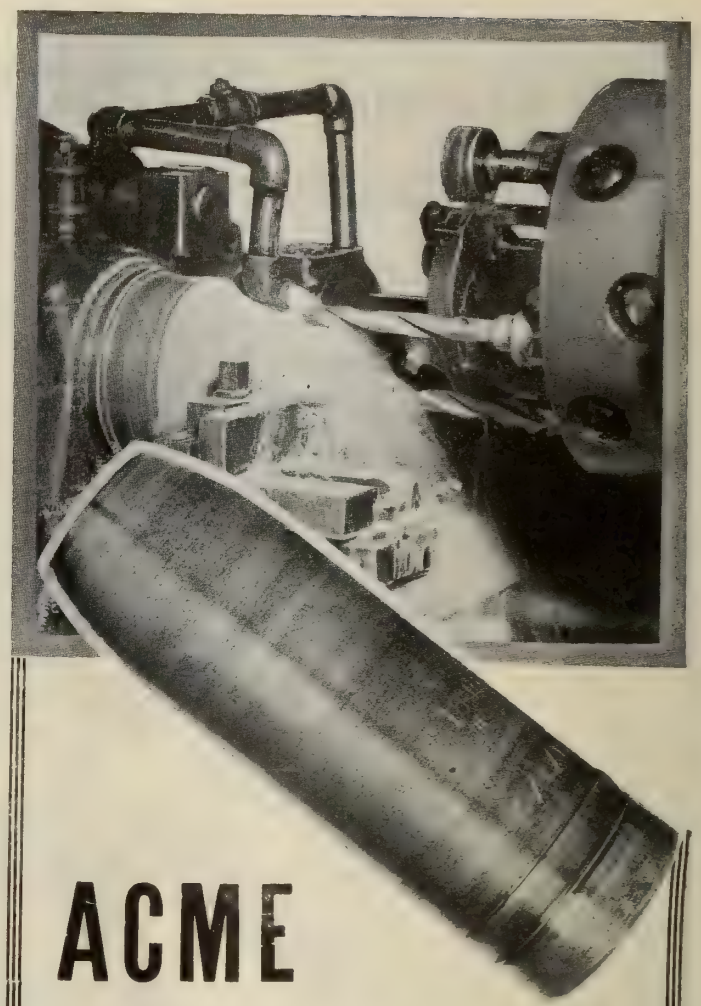
EVERY inch of it is uniformly coated with Aloxite grain—hard, sharp, tough, fast cutting.—Aloxite Cloth cuts faster, lasts longer, leaves a better finish.

Get it in economy rolls, cut in handy widths, wound on a spool—or in sheets, reams, or rolls.

*From your hardware dealer or direct. May we send sample sheets?*

**The Carborundum Company**
**Niagara Falls, N. Y.**





# ACME

## Cutting Lubricant used on Shrapnel Shells

Keeps the tools clean and cool and increases production.

"Acme" is a free, unsaponified, animal oil lubricant, which will not separate in solution, gum machines or rust the work.

"Acme" will not clog pipes or stick to the finished work as oil does. Has a clean, wholesome smell.

Leading manufacturers use it on shell work in preference to oil; costs less, increases production.

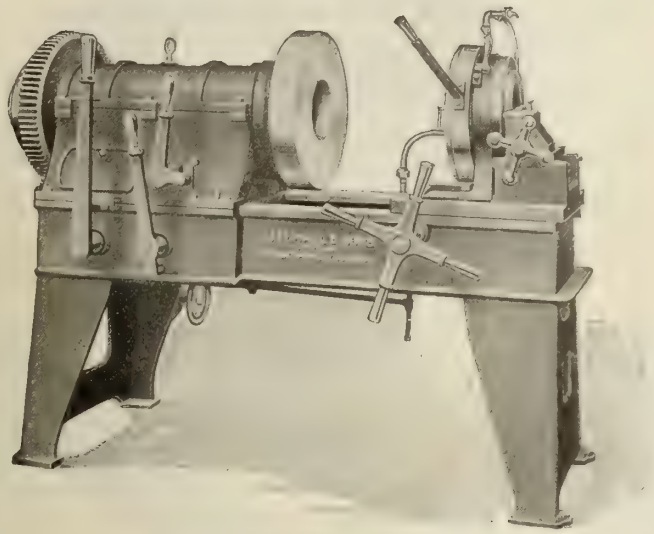
Use it on your Gear Hobbers, Milling Machines, Turret Lathes and Automatics.

*We solicit your trial order and will ship on thirty days' approval, subject to practical test.*

**Cataract Refining Co., Limited**
**TORONTO, ONTARIO**

(MADE IN CANADA)

# THE HALL NO. 6 PIPE MACHINE

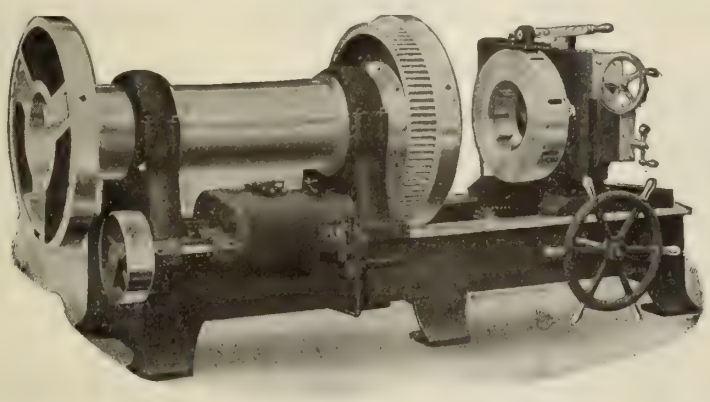


When you buy Hall Machinery you keep Canadians employed. We are a Canadian firm, employing none but Canadian labor. Our guarantees are not at "Long Distance." We are at your door.

Our Machinery is the best that mechanical ability can produce and does not cost as much as imported machinery.

Write us for catalog and prices on pipe-threading lathes, any capacity, from ⅛ to 18-in., also single and double head rapid nipple machines. No delays, delivery from stock.

## JOHN H. HALL & SONS, LIMITED
### BRANTFORD, CANADA



## Up to a Standard

All our years of machinery manufacturing experience has been concentrated on pipe-threading machines. We have built long life and supreme satisfaction to pipe machine users in every machine we turned out. The machines are built up to a standard, not down to a price. Convenience and safety of the operator are a part of the general design.

*Send for the catalog of these "up to a standard" machines.*

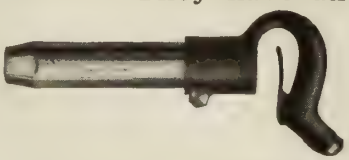
## CLEVELAND RIVETING, CHIPPING, CALKING AND BEADING HAMMERS

MOST POWERFUL AND EFFICIENT AIR TOOLS ON THE MARKET

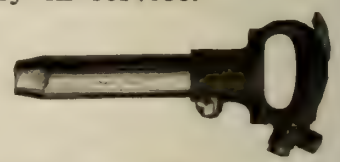
Cleveland Riveters are made in 20 styles and sizes with driving capacities of ¼-in. to 1½-in. rivets in Boilers, Tanks, Stacks, etc.

**They have an enviable record for durability and economy in service.**



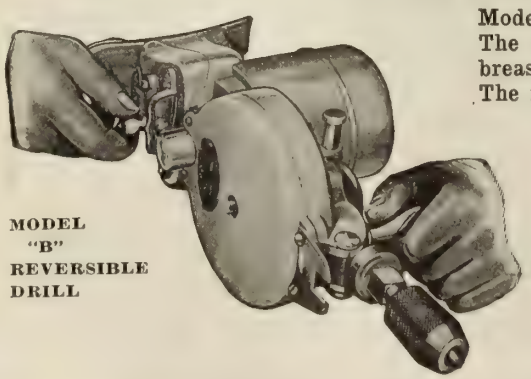
### CLEVELAND CHIPPING HAMMERS

are made in 20 styles and sizes to suit all classes of work. They are ideal tools for foundries, as they have high speed, no recoil and are practically dust-proof.



**In stock: Riveting and Chipping Hammers, Air Drills, Corner Drills, Sand Rammers, Portable Grinders, Bowes Couplings, Chisels, Rivet Sets, etc.**

### PORTABLE ELECTRIC DRILLS



MODEL "B" REVERSIBLE DRILL

Model "B" Drill illustrated, shows compactness of design. The Casing, Switch and Gear Covers are aluminum; the breast plate, motor-head and handle supports are of steel. The machine is light in weight, convenient in shape; has high speed; operates on either A.C. or D.C. currents and runs either forward or reverse as desired. Model "C" has two speeds and in construction is similar to Model B.

Bulletins mailed on request.

# FOR WOODWORKING MACHINERY

Lancaster, Ohio, July 7th, 1911.

Gentlemen:

In regard to Magnolia Metal desire to state that I have used it for the past twenty-five years on planers, moulders, exhaust fans and all high-speed woodworking machinery running up to 4800 r.p.m., and it has always given the best results of any.

Yours very truly,

The West Side Lumber & Mfg. Co.,

OTTO F. BRETH.

CENTRAL PENNSYLVANIA LUMBER CO.

Williamsport, Pa., April 13th, 1912.

Dear Sirs:

I have used Magnolia Metal for a number of years with the best of success, and can recommend it to all who wish a tough, homogeneous white metal where great compressive strength on fast running machinery is required. I have used it with the best of results on planer spindles running 4500 r.p.m., on lathe mills running up to 3300 r.p.m., and on all bearings of saw mill machinery.

Very truly yours,

H. P. WELSH,
Supt. of Mfg. & Shipping.

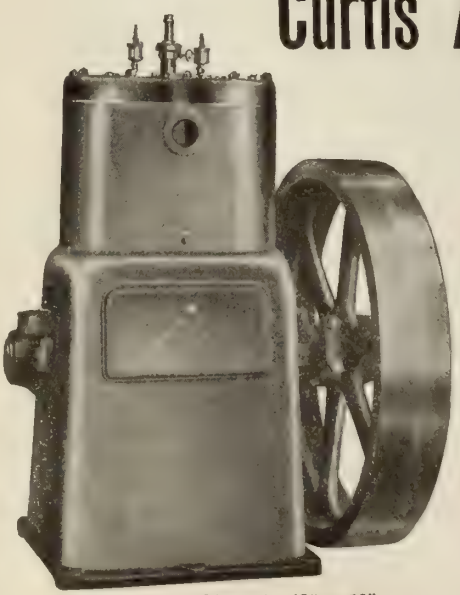
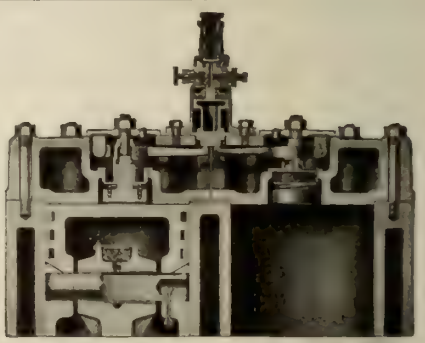
# Curtis Air Compressors



In sizes 6" x 6" up to 12" x 12".



Cross Section Through Suction Valves and Governor.

**COOLING.**

Cylinder heads and valves, as well as cylinder walls, are water jacketed, with about 80 per cent. more water-cooled area than double-acting compressors, insuring a lower temperature with resultant larger intake, less expansion of air before compression and less shrinkage and loss of power after.

**FEW PARTS**

Having no stuffing boxes, no piston rods, no cross heads and no crosshead guides, there is less friction, less power required, less oil, less attention and less chance for breakdowns.

**LIGHT VALVES**

The valves (the heart of the compressor) being light vanadium steel discs, about one-sixteenth of an inch thick, operate earlier, have more seating area, remain airtight longer and leave less dead air space than valves of poppet type.

**SMALL CLEARANCES.**

The smaller the dead air space at end of compression stroke, the less heated air will be left in the cylinder to mingle with and lessen the amount and density of intaken air. Look at the design above—the valve discs are only one-sixteenth of an inch thick. Nuff sed!

# Utilization of Time Study Data in the Machine Shop*

By R. Thurston Kent**

*In the introduction to his paper, the author makes reference to two ways in which time study data are generally procured, afterwards pointing out, that anything short of the elementary analysis of each individual type machine operations is not only crude and expensive, but sure to fail in its purpose of securing permanent and reliable production cost records.*

THE object of time study is to determine the amount of work which a man can most efficiently perform in a day. Time studies can be taken in two ways. Each job that goes through the shop may have the watch held on it, and the over-all time of the job, or of its most important subdivisions noted. In the course of years there will accumulate a great number of records of jobs done, the time required for, and the methods used in each. These records will prove invaluable in setting rates and fixing minimum times for similar jobs as they recur from day to day. They are, when properly indexed and filed, a long step in advance of the earlier method whereby rates have been fixed "off the bat," as it were, by the foreman or rate setter, which rates are largely based on the judgment or guess of the individual who sets them.

### Crude and Expensive Method.

Regarding wage payments and disputes, they present indisputable testimony that the rate is fair, for they represent the time and rate of some former workman who accomplished the job easily. They also enable the management to foretell with considerable accuracy how much any particular job is going to cost as regards the labor expended on it. Such a method of making time studies, however, is crude and expensive. It does not give that information most to be desired—aside from the length of time required for the job, as to the most efficient method of performance. It furthermore does not enable the fixing of an accurate rate on a new job unless it is quite similar to one which has been done before.

It is obvious that before a shop, doing even a routine line of work, can accumulate an amount of time study data, which will be useful, a long period, probably several years, must elapse, and the expense of obtaining these data will be out of all proportion to the benefits returned to the shop during the earlier portion, at least, of the period while the studies are being made.

### Elemental Detail Method.

The second method of time study is that of analyzing all machine and work handling operations into the most elementary detail, separating such particular part of an operation into its smallest elements, and tabulating these elements together with their respective times. These elements are then grouped into appropriate classes and filed in such a manner that any element of any particular class can be readily found when desired. This being done, its is a comparatively easy matter to fix a time for a job which has never before been done in the shop, with the certainty that the time to set will be accurate, fair alike to employer and employee.

The method of consistent machine analysis will enable the manufacturer to accumulate in a comparatively short time an amount of time study data which will be applicable to a large portion of the work of his shop, and every addition to the data will widen the scope of his time study and rate setting department in an increasing degree.

This method of elementary anaylsis is logical, although at first sight it may not appear to be the easiest one. The natural tendency is for a manufacturer to obtain first a study of the time required for the most important job or the job that recurs oftenest in his establishment, and to then take up in their order the jobs of lesser importance. He feels that he is by this method making the biggest hole in shop inefficiency. He may, and probably will, get quicker results on that particular job but he is far from making as big a hole as he would were he to adopt the other method.

### Complexity of Machine Tool Building.

The building of a machine tool is a rather complex proposition requiring the machining and assembling of a great variety of different pieces of varying shapes and degrees of finish. Nevertheless, every one of these many parts can be resolved into a comparatively small number of machine operations. In general, machine work can be divided into the turning of cylindrical surfaces, the planing or milling of flat surfaces and the drilling and boring of holes. Every piece that enters into a machine tool is a combination of these various surfaces. This gives us our first subdivision of our time study element. If we know the time required to turn a given cylinder of a known diameter, to plane or face the ends of it and to drill a hole through it, we have a means of ascertaining with fair accuracy just how long it will take to produce the piece in the machine shop. It is unnecessary to add, to the time required for performing these various machine operations, the time necessary to put it in the lathe, planer or drill press and to remove it from these machines. We, therefore, subdivide our time studies, first by the machines on which they are made.

### Individual Machine Performance Subdivision.

Each machine should be studied in the greatest detail in order that the various operations which can be performed upon that machine may be combined with one another to represent the sequence which is to be followed in producing any given piece. This is not as large a job as it seems. Although almost any kind of machine work can be carried out in the ordinary engine lathe, the number of individual operations that a lathe will perform is comparatively limited. Thus the entire art of lathe work may be comprised in the following:

We may shift the belt from one cone to another; we may engage or disengage the back gears; we may change the feed gears; we may move the carriage along the ways; we may operate the cross-slide; we may set the compound rest; we may throw in or throw out the automatic feed operating either carriage or cross-slide; we may move the tail stock from one position on the ways to the next; we may set the tail-stock over one way or the other for the purpose of turning tapers, or if the machine has a taper attachment, we may connect the cross-slide to it or disconnect it; we may put on or remove a steady rest or follow rest; we may move the face plate and put on a chuck or vice versa; we may remove or replace head and tail centres; we may put in the tool post or remove from it one or another type of tool; we may start or stop the machine; we may engage or disengage the nut for screw cutting; we may advance or retreat the tail centre.

These fourteen operations represent practically everything that can be done with an engine lathe and yet the combination of these fourteen elements in varying sequences and numbers will enable us to perform pretty nearly any job of machine work which may be desired.

*From a paper read at the recent convention of the National Machine Tool Builders' Association Convention.

**Consulting Engineer and Scientific Management Specialist.

It is true that many jobs which could be done in the lathe can be done more efficiently in another type of machine, but the fact remains that, if we have only a lathe available, we can perform practically any job that comes into the machine shop by a combination of fourteen different types of machine movements.

It, therefore, becomes evident that by making an exhaustive study of all the lathes in a machine shop, that is, all the lathes which have different characteristics, we have accumulated an amount of data which will enable us to fix unit times for the performance of all the jobs which it is possible to do in the lathes in that shop. This is the method advocated for making time study by those who have spent the greatest amount of time at this work. In similar manner, the operation of a planer, of a shaper, of a drilling machine, of a slotter, of a boring mill, of a milling machine or of any other machine tool can be resolved into a comparatively small number of machine movements, which can be studied as to the time required for each, and which can later be combined in any shape and sequence necessary for the performance of any job which may come to that machine.

It is obvious, therefore, that the method of analyzing a machine and its handling time, will be productive of real results in the shape of accumulated data more quickly than will any other method of time study. It is true that the machine operations must be analyzed and studied completely before the data can be used. A partial study will be of but little value in setting a general run of tasks, for in all probability the particular machine item which may be needed in setting the task on a given job will be the one on which no time study has been made. The complete study of a large number of machines does not require such a great amount of time as might be imagined.

### Different Machine Operations Subdivision.

We have seen how time study data should first be subdivided according to machines and then according to machine operations. We will go into this detail a little more closely at this time to illustrate how finely the different machine operations should be subdivided before they are tabulated for re-combination into elements forming complete jobs in the shop. One of the commonest operations which occurs in lathe work is the placing of the cutting tool in the tool post prior to cutting metal and the removal of it from the post upon the completion of the machine operation. The time given in studies on lathe work made by Mr. Merrick for putting an ordinary three-quarter inch turning tool in the tool post of a twenty-four inch lathe is 0.30 minute. This time is made up as follows:

| | Min. |
|---|---|
| Get tool from tray at end of lathe | 0.03 |
| Measure height of tool | 0.06 |
| Put packing in tool post | 0.07 |
| Set tool in position | 0.03 |
| Tighten tool post set screw | 0.08 |
| Total | 0.30 |

The time for removing the tool from the post is tabulated as follows:

| | Min. |
|---|---|
| Loosen tool post set-screw | 0.03 |
| Remove tool to tray at end of lathe | 0.05 |
| Total | 0.08 |

If it be necessary to change from one tool to another during the course of the machine work, we have in the same tabulation an item entitled "changing tool." This is made up as shown below:

| | Min. |
|---|---|
| Remove tool (as above) | 0.08 |
| Put in new tool (as above) | 0.30 |
| Total | 0.38 |

In the same tabulation, we find one more item, "Set tool for bearing, 0.17 min." This item refers to the setting of a square-nose finishing tool to bring it square with the surface of the work and is to be added to the time required for setting the tool in the post. Thus, if we had to set in the tool post a square-nosed finishing tool, the analysis of the operation would appear as in the first table with the additional item, "Set tool for bearing" added, and the total time would be 0.47 min. instead of 0.30 min.

### Instruction Card Feature.

While the operation of tool handling is analyzed in the detail explained above, it is in practice put on the instructions issued to the men in the form shown. The total time only for the entire operation of tool setting will be given appearing on the instruction card as as item, "set tool in post, 0.30 min." The value, however, of the detailed analysis is that if the time, 0.30 min., is ever questioned as being too long or too short, we have available the elements which enter into the making up of this time and can easily ascertain in which particular part of the study the workman or the time study man was at fault.

This is not a particularly good example, however, of this advantage, as the time 0.30 min. is not liable to be questioned unless it is one that recurs quite frequently. In any case, the principle remains the same whatever the operation may be. There are many jobs the individual operations of which occupy many minutes, and if these operations are questioned the detailed analysis is always available to show what the workman is expected to do and how long each element should require. If a workman can not complete his job in the time fixed, a comparison of his work with the detailed analysis—the watch being held while the comparison is made—will frequently show that he is exceeding the analysis time in one particular element only and that a correction of his work as regards this element will often bring his performance well within the time called for by the time study.

### Individual Elements Combination.

Returning to a consideration of the combination of individual elements for the making up of a unit time for a job. In the first table which we cited, that giving the time for putting an ordinary turning tool in the tool post, we had a list of all the elements common to any tool. In establishing unit times for handling different types of tool than the ordinary round nose turning tool, we have only to add to the elements for that tool those items which are different in the tool under consideration. We have already seen what change is made in the analysis for a square nose tool. For a chamfering tool or a facing tool, we have only to add to the analysis for the turning tool the item of setting the tool to a bearing. For a thread tool we have to add the additional item, "set tool to thread gauge." Thus, in determining unit time for handling any type of tool in the lathe, we can simplify both the time study and the tabulation by first studying the handling of that tool which contains all the elements which the other tools require, and then studying those particular elements which are different in the remaining tools.

After having determined a series of elements of various character, such as the putting of the tool in the tool post, these elements can be combined with others similarly determined to form complete fundamental operations which enter into the completion of a definite job. Such a fundamental operation is the setting and starting of a cut. In the compilation of time study data with which the writer has been working for a number of months past, the setting and starting of cuts in a great many different sizes of lathes, and with practically every variety of cutting tool are tabulated in a manner similar to the following. This tabulation is for the setting and starting of a cut with a round nose, rough turning tool in a 24-inch lathe:

| | Min. |
|---|---|
| Put tool in post and tighten | 0.30 |
| Start machine | 0.03 |
| Set calipers | 0.35 |
| Set cut by eye or calipers | 0.20 |
| Put feed in | 0.03 |
| Total | 0.91 |

In writing up the instruction card, this item would be listed simply as "set and start cut, PRB $\frac{3}{4}$-in. tool—0.91 min." After the cut has been completed, if the tool is to be removed, the following items are taken together from

the analysis to give the time for stopping the cut and removing the tool.

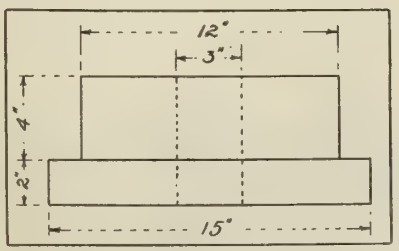
| | Min. |
|---|---|
| Throw feed out | 0.03 |
| Run tool half way back | 0.05 |
| Run carriage back | 0.05 |
| Stop machine | 0.10 |
| Loosen and remove tool | 0.08 |
| Total | 0.31 |

| | Min. |
|---|---|
| Set cut by eye or calipers | 0.20 |
| Put feed in | 0.03 |
| Throw feed out | 0.03 |
| Run tool half way back | 0.05 |
| Run carriage back | 0.05 |
| Total | 0.36 |

It will be observed that in this tabulation the same items appear as in the former ones, except that they are grouped slightly different, and the items of removing the tool and stopping the machine are omitted, as these operations are not performed when repeating a cut without removing the tool from the tool post. These tables are a fine example of how elementary time study enables one to build up unit times for different operations. Having the data necessary to fix a time for setting and starting a cut analyzed in the detail exhibited in the first two tables above, it is unnecessary to make a study of the time required for an additional cut. The man familiar with machine work can list without any trouble just what motions the lathe hand goes through in running his tool back and restarting the cut. These are as given in the table above. Having the time for these various items exhibited in the earlier tables, it is only necessary for him to set them opposite the items in the new table and total them, and he has the proper unit time for making an additional cut with the same tool.

Examples could be multiplied indefinitely to show how the various elements are combined and built up to form larger and larger fundamental operations until we have a total time for a complete job. The above, however, is probably sufficient to indicate the principle involved, and those interested can pursue the study as far as they care to do so.

## Typical Instruction Card



Material: Cast iron.
Weight: 200 pounds.
Finish all over.

| | | Preparation. | Handling work. | Handling tools. | Handling machine. | Removing metal. |

On the instruction card this item would appear simply as "stop machine, remove tool—0.31 min." If, however, the tool were to be run back to the beginning of the cut and an additional cut taken, we would use another set of items appearing in the same tabulation, as follows:

### Preparing Instruction Card for Lathe Work.

We will now take up a concrete illustration of the application of the principles of elementary time study to the preparation of an instruction card for a job of lathe work. The instruction card, which is shown in this connection, is modified in form in order that the different classes of elementary times may be separated for purposes of illustration. In all time study we divide the work into general classes of preparation time—that is, the time necessary to prepare the machine for receiving the work and for restoring it to its standard condition after the job is done; the handling time of the work itself—that is, the time required to place the work in the machine, remove it, and perform any manipulations which are necessary to put it in place for machining. This includes hoisting and landing it in the machine, chucking, truing, leveling, squaring and similar operations; tool handling time, that is, the manipulation of the cutting tools, putting them in the tool posts, removing them, etc.; machine handling time, which includes all machine manipulation, such as moving the carriage, changing speeds, setting and starting cuts and similar operations, machine time, which represents the time actually employed by the machine in removing metal.

The first four sets of times are determined by elementary time study, while the last set of times can best be determined by means of the slide rules devised by Mr. Barth. To use these slide rules, however, requires that the ma-

chines be standardized as to feeds, speeds and pulling power according to the rules formulated by him. Unless this standardization has been made, the machine time must be determined by other methods which are slower and more cumbrous.

Referring now to the instruction card shown, we see that it calls for the machining of a cast iron piece weighing about 200 lbs., which is to be finished all over and to have the hole in the centre bored. It is assumed that a roughing and finishing cut is to be taken for every operation and that different tools are to be used for turning and facing, this being in accordance with the practice of the shop from whose time studies this instruction card was written.

An inspection of the instruction card will show that the first operation is the removal of the face plate which normally remains on the machine and the replacement of it by a four-jaw independent chuck. A reference to a tabulation of times for handling face plates and chucks shows that 0.49 min. are required to remove the face plate and 2.08 min. to lift the chuck from the floor by means of a hoist and screw it upon the spindle of the lathe. Both of these items are in the tabulation sub-divided into their elementary details as explained earlier. Another tabulation shows that it requires approximately two and one-half minutes and two minutes respectively to land a 200-lb. piece of the approximate dimensions shown in the lathe chuck and to true it.

The sequence of operations followed in machining the work is clearly shown by the instruction card, including the turning of the work end for end in the chuck in order to turn and face the flange of the piece. It will be noted that although there are fifty-seven different items listed, the actual number of operations performed is considerably less than this. A study of the card will show that most of the operations, such as "set and start cut" recur from time to time. We have in item No. 6 our old friend, "put tool in post—0.30 min.," and in items Nos. 12, 18, 22, 29, 43, 46, 49, the combination of the items "put tool in post" and "remove tool from post." It will be recollected that the sum of these two items, as given earlier, was 0.38 min. We could in writing the instruction card, of course, have subdivided the items "change to rough facing tool," etc., as above, and have given the separate times of 0.30 min. and 0.08 min., but this would have accomplished nothing except to increase the length of the instruction card. The two items are, therefore, combined in one, as shown.

Referring next to item No. 9, "set and start cut 0.23 min.," this is made up of the items of setting the cut by calipers, starting the machine and throwing in the feed. We have the same time in item 40, which is a cut started under the same conditions as that represented by item No. 9. In item No. 13 we have a time of 0.34 min. for setting and starting cut. It will be observed, however, that this is a facing cut, and that there are some additional operations to be performed as compared to a simple turning cut. These include the tightening of the carriage nut after the cut is set and the loosening of it at the conclusion of the cut. In items Nos. 23 and 51, we see a still different time for the setting and starting of cuts. These, it will be observed, are "finish facing cuts," and it will be recollected that in the setting of a finishing tool there is the additional item "set tool for bearing" to be added to the time required for setting the ordinary roughing and facing tool.

Turning now to the totals of the several columns, it will be observed that 7.39 min. are required to prepare the machine for the work and to clean it up after the job is finished. The actual handling of the work consumes 11.21 min. The handling of the cutting tools requires 4.29 min., and machine manipulation accounts for 5.85 min. A total of 34 min. is required for the actual removal of metal, giving a grand total of 62.74 min. The fatigue allowance would bring the time for the job to about 75 min. The interesting thing about these tools is that the machine is working only a little over 50 per cent. of the time, if the fatigue allowance is not considered, and less than 50 per cent. if the allowance is taken into consideration. This points to two things:—(1)—The importance of studying closely the manipulation both of the machine and of the work. (2)—The value of time study in increasing the relative producing time of the machine. Let us consider these two items in order.

There is no doubt but what a man sitting at a desk carefully studying a drawing of a piece, such as is shown here, can plan out the sequence of operations in manufacturing it much better than the man at the machine, who must necessarily keep his attention on the work while the machine is in operation, and do his planning between cuts or do it all in advance of starting work. In either event the machine will be idle a greater length of time than is necessary. The man at the machine will have a tendency to consider each operation by itself and thus introduce more machine manipulations than are necessary.

For instance, the chances are that left to his own initiative the workman would introduce the finish turning cut immediately after the first rough turning cut, requiring an additional machine manipulation, as compared with the method laid down in the instruction card, which calls for the rough facing cut immediately after the rough turning cut, thus saving running the carriage back once. With the work planned out for him by a man preparing an instruction card showing the best method and the one requiring the least handling of tools and machine, the workman can keep his machine at the business of making chips for the greatest possible length of time, and it is only while it is making chips that a machine is making money for its owner.

**Relative Producing Time of Machine.**

The second item offered for our consideration is the value of time study in increasing the relative producing time of the machine. This has in part been covered above, but the particular feature in mind is that the handling time in machine work bears a much greater proportion to the total machine time than is commonly realized. It gets us little, if we standardize our machines so that we can use Mr. Barth's slide rules and thereby set speeds and feeds, which will reduce the time required in removing metal by 10 or 15 per cent. if we do not at the same time set an equally high standard for the necessary but unprofitable work from the standpoint of machine earning capacity of handling and manipulation. If we decrease the cutting time 10 per cent., but at the same time do not check the workman up on his handling time, so that he increases it 15 per cent. to be sure that he will not produce too much in a day and, therefore, suffer a cut in rate, we have actually lost money if the ratio of handling and machine time is about as was shown in the example just exhibited.

By itemizing the handling operations, as was done in the instruction card just shown, and by setting unit times which have been carefully determined by elementary time study, we have furnished a standard of performance to which we can hold the workman. The standard is not an unfair one, because it is determined by the performance of other workmen, and is a standard which, if the time study has been accurately made, is one which can easily be obtained by the ordinary good man. The mere fact that there is a standard by which the performance of the workman can be measured will in itself tend to increase the effort of the man to do his best. The standard being present, any failure to attain it can be investigated and the particular point wherein the man failed can be indicated to him, and his fault corrected. It has been found time and again that where this standard of performance has been omitted that the handling time in all machine work has gradually increased with a consequent decrease in the relative producing capacity of the machine.

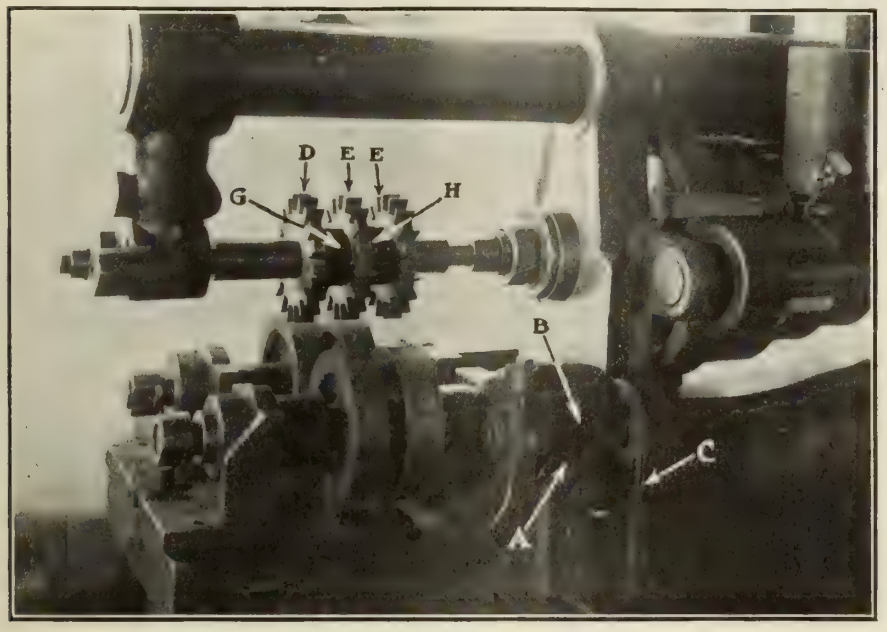
# PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

## MILLING OUT GEAR BLANKS.

By A. E. Granville.

A RATHER unusual method of machining gear blanks is followed by an Eastern firm. The blanks are bored out and the ends of the hub faced. They are then placed, four at a time, in the fixture shown. The two spindles, by which the work mandrels are revolved, have worm gears in the fixture housing next to the milling machine column. These worm gears mesh with worms on the same shaft with worm gear A.



MILLING OUT GEAR BLANKS.

A worm B is driven from a sprocket and chain C, which gets its movement from a sprocket on the universal jointed feed shaft. As the gear blanks are slowly revolved, the table is raised, feeding the work to the gang of cutters on the milling machine arbor. The three side mills, D, E and E, finish the sides of the gear blank rims and the cutters G and H finish the outside diameters. As four blanks are milled at once, the method is a fairly rapid one.

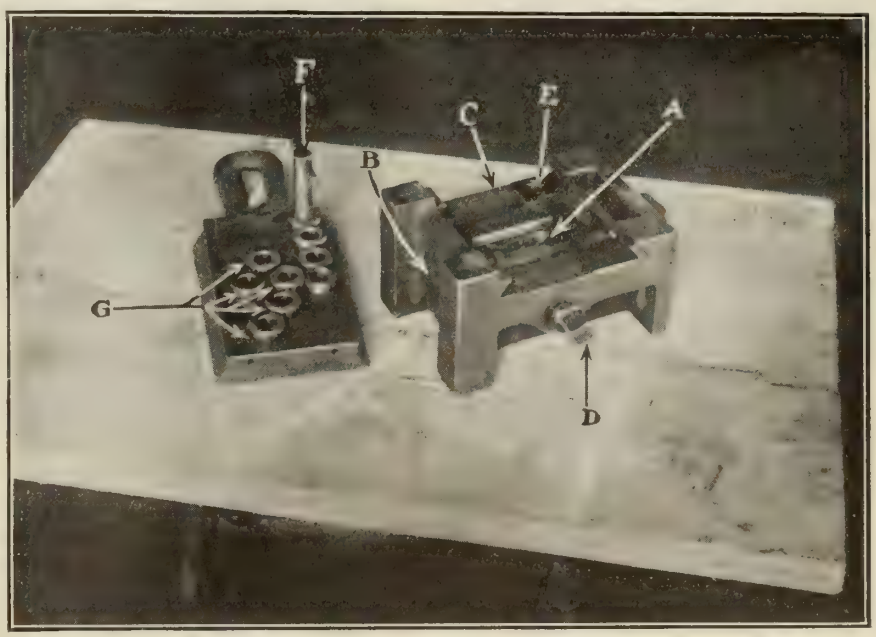
## DRILLING SLOTS IN BARS.

By. E. Avery.

IN drilling holes in boring bars, tool posts and the like, it is often hard to drill out enough of the metal to make the hand-finishing job an easy one. A lot of the web left has often to be chiseled out, with the chance of making an ugly mess of it. Even when the slot is finished by milling, the chisel often has to be used first.

The jig shown is a very handy tool to have about the shop, if made sufficiently large to take in the average run of such work. A tool post, which has just been drilled out, is shown in place at A. This has been slipped in through the hole B, and is held against the V-block C by means of the heavy set screw D. There is a bushed hole at E into which the locating pin F may be thrust through any of the four bushed holes in the slide. The use of the pin in these holes locks the various drill bushings G in position over the work so that a practically continuous slot may be drilled.

The method of locating the drill bushings in this way gives plenty of room to use heavy bushings solidly set. A regular drill may be used for the end and middle holes of the slot if desired, but better results will be obtained if a drill ground more bluntly is used for the webs that are left. A comparatively small amount of filing is needed to finish the slot thus drilled.



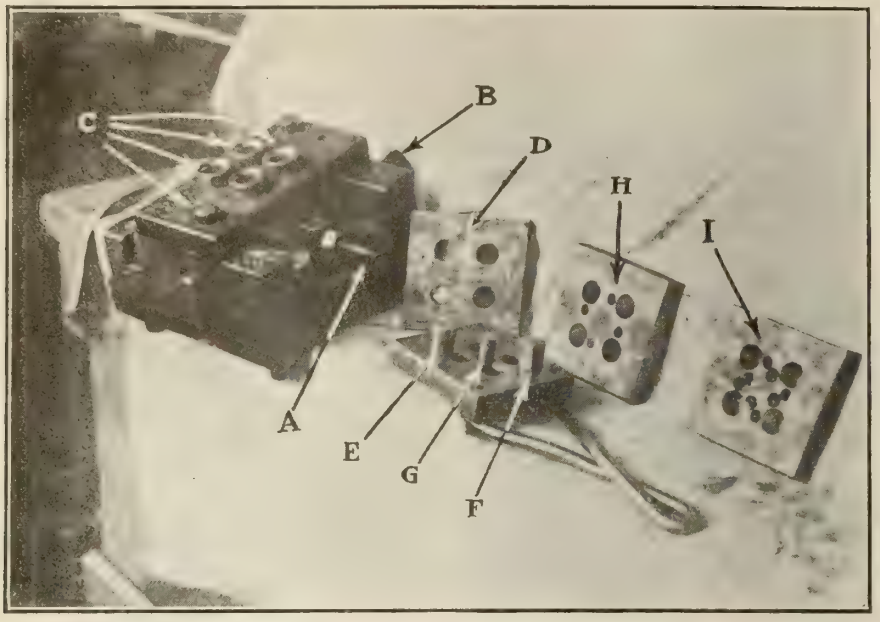
JIG FOR DRILLING SLOTS IN BARS.

## DRILLING OUT SOLID THREADING DIES.

By G. Edwards.

WHERE pipe or other solid threading dies are made in the shop, and the threads are cut with a fine-fluted hob, the jigs shown will be found good for drilling out the superfluous stock. The blanks are first sawed from the bar, and are then placed in the jig shown at the left in the illustration. They are pushed in against the stop A, and are locked in with the set screw B. Four corner holes are then drilled through the bushings C, the result appearing as shown at D. The jig with the handle is then placed in the drilled blank, with the two pins E and F in diagonal holes. The pin G is a sliding one used as a knock-off. Four smaller holes are drilled with this jig, the blank then looking as shown at H. Another similar jig is used for the four

additional holes in I. The centre may now be broken out with a heavy punch and hammer. These jigs have the merit of being cheap and easy to make, as well as sufficiently accurate for all practical purposes.



JIGS FOR DRILLING OUT SOLID DIES.

## SAVING TIME IN GETTING OIL.

By E. Lock.

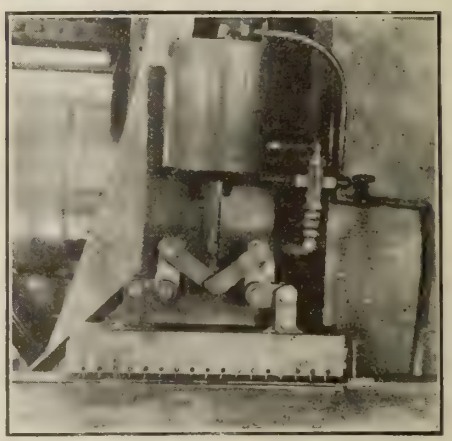
A WORKMAN often finds his oil can empty, and a boy to send to fill it nowhere to be seen. To offset such a contingency, the Macon, Ga., shops of the Central Railroad of Georgia uses the type of supply stand shown. These are placed at frequent intervals throughout the various departments, more, of course, in the machine shop. The top of the tank is hollowed-in, so that any surplus oil from an overfilled can will run back into the tank. The whole apparatus costs little to make, and is soon paid for in the saving of the workmen's time.

A CONVENIENT OIL TANK.

## PUNCHING HOLES IN LOCOMOTIVE JACKETS.

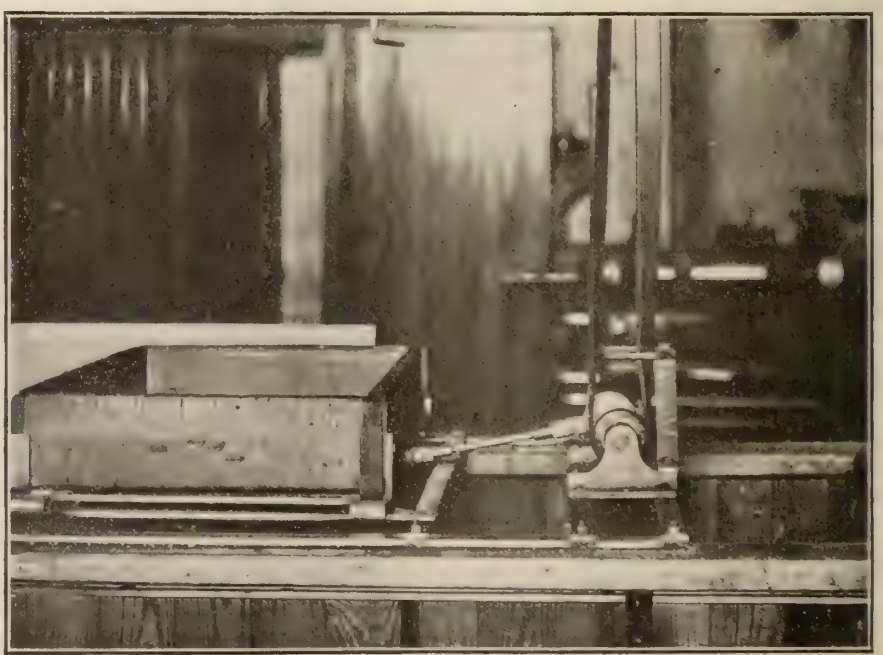
By E. Avery.

THE machine shown is used for piercing holes in locomotive jackets. The punch-holder carries seventeen 3-16-in. punches for punching as many holes at once.



LOCOMOTIVE JACKET PUNCH.

From the method of attaching the punch-holder to the piston of the air cylinder, it will be seen that the two bell-cranks and toggles cause the holder to make an up and down stroke for each movement of the piston. Every time, therefore, that the piston goes up or down, the punches go down and up. This saves considerable time, and also utilizes the long stroke of the piston.



MECHANICALLY OPERATED SCREENING MACHINE.

## A SCREENING MACHINE.

By A. G.

A HANDY little time saver is shown in the illustration. This is a mechanically-operated screen, used to sift shavings from the work when taken from small screw machines. The screen box may be lifted off and emptied at any time. With the screen in place, a boy dumps in a bucket of chips and screw machine products, and then goes for another lot. By the time he returns, the work has all been sifted and is ready for removal.

# Notes and Observations on Modern Foundry Practice--II.*

By R. Onions

*In the introduction to his paper, the author referred to the fact that the art of iron founding was in existence previous to the written records of history. He at the same time hazarded the suggestion that to the scientist and practical man of to-day it offered not only a wide field for research, but one also in which individuality had the widest possible scope.*

IN our June 17 issue, the subject matter discussed consisted of core-making, green or dry sand castings, machine molding, plate molding, chills, cupola management, castings cost, management and organization.

### Runner Basins and Gates.

Runner basins and gates are the channels found in the sand and provide the way by which the metal enters the mold from the ladle. They also serve to feed the mold after the pouring by means of a rod worked up and down by hand, giving a kind of impact to the metal itself, which fills up any thick portions that may have been drawn upon as the casting cools. The cavity where the metal is first received from the ladle is known as the runner-basin. All vertical passages are known as down gates, and the horizontal passages as in-gates or sprues.

As shall be seen directly, the disposition, shape and area of these gates and basins are important and interesting details. They bring into play principles, such as are met with in hydraulics, as vortices, centrifugal force, velocity and momentum, each of which property may be eliminated or taken advantage of as may be considered desirable for any particular case. On them depends the fate of the casting, and whilst in some cases a clean casting may be got at the expense of an enormous riser or header, it will be found, with a more suitable gate, that a much smaller header, or indeed no riser at all, will be required.

### Molder's Experience a Factor.

The moulder has to rely entirely upon his experience as to what combination of the principles involved will form the best runner for any particular case. Generally, the metal must enter the mould quietly, and with as little velocity as possible. There are instances, however, where a fairly high velocity is a distinct advantage, as in the case of a ring or line, Fig. 1. Then, a small in-gate is made at a tangent to the mould, and a large down-gate. We as a result have a swirling motion which keeps the metal agitated, and so the dirt, being lighter and not allowed by the agitation to cling to the core or mould, is carried to the top. This swirl, under favorable conditions, will be maintained to a height of 18 in. or 20 in. in a liner with a 15-in. core and 1¼-in. metal. As this principle cannot be taken advantage of for liners which are over 20 in. long, other means have to be resorted to, and other difficulties creep in for which provision must be made.

### Runner-Gate for Long Liners.

Fig. 2 shows an arrangement of runner-gate and sprues which have been found

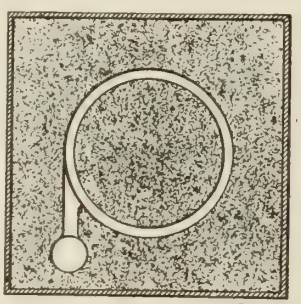


FIG. 1. GATING TO PRODUCE A SWIRLING MOTION.

to do well on long liners. In this case we have to keep the metal "alive" or agitated as well as possible all the way up, whilst we have also to counteract the cooling influence of the core and mould because of the relatively large surfaces exposed to the metal. It will be noticed that the metal falls direct from the runner-basin into a knob, with which the in-gate is connected, and this leads to an annulus formed around the core, from which lead several small

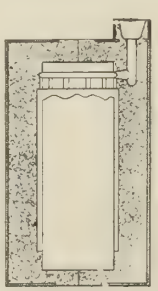

FIG. 2. GATING FOR LONG LINER.

sprues, equally spaced all around. It will be seen that with a large down-gate exceeding the combined area of the small channels, the metal will fill the knob, and also keep filled the annular space, and so make all the small sprues effective.

We then have a kind of shower bath, which is falling all the time on the surface of the metal, keeping it in agitation, breaking up the kish and oxide which forms into a mass as the metal is rising, this mass being easily caught by any depression or belt on the liner, and so carrying the dirt to the top. The in-gate in this case is made a little taper so as to increase the velocity of the metal and send it as quickly as possible around the core, and so, by coming in close contact with the core and mould, keeps the surfaces heated in front of the rising metal. Large liners may be cast in this way with a riser only a few inches long and no thicker than the casting itself.

### Runner-Basin Features.

It may be well here to examine what features there are common to runner-basins and gates, which are found in practice to give good results, and the reason why. Fig. 3 illustrates an ideal form of runner-basin, and common to all conditions. In this a knob is provided, into which the metal from the ladle is poured. By this arrangement the metal is instantly quietened, and the velocity as it leaves the knob is so small that any dirt has time to float. It will also be noticed that the shape of the basin immediately over the down-gate is square, and it is most important that it should be so, because it goes to prevent a vortex, as it is well known that any swirl over the gate tends to bring down dirt which would otherwise remain in the head. With this form, no vortex can be noticed until the metal gets about half-way down the basin; this is a detail the importance of which moulders generally do not appreciate.

The flow of metal from the ladle to the runner-box is under observation, and the rate at which it is poured may be regulated so that the header is always about full, and by ordinary care a constant supply can be maintained, which goes towards a quiet entry, and minimizes splash. Whilst this form of basin may take a few more minutes to make than other forms, it will be found to pay well to adopt, and where specially clean work is required, a plug should be used over the gate, to allow of the basin being filled.

### Simple But Unsatisfactory Runner-Basin.

In Fig. 4 is shown a form of runner-basin which is much more simple and quicker to make. It is, however, unfortunately an exception to the general rule in foundry work that the simplest and

*From a paper read recently before the Manchester Association of Engineers.

least-complicated is the best. This is a runner-basin of the worst kind, and, it will be seen, defeats all the points those shown in Fig. 3 are designed to achieve. We have here a basin situated directly over the down-gate, which has the objection that the the metal is most likely to splash in the mould, particularly on the commencement of pouring, where the man handling the ladle often gets in such a position that too much metal is leaving the spout, and this he suddenly checks to a too small amount, and so the pouring oscillates as it were for a second or two before settling down to a regular flow.

It may easily be seen that, as regards Fig. 3, any such irregularity does not tell directly on the down-gate. Metal if allowed to rush into a mould causes by its momentum undue pressure, strains the mould, tending to lift the top box, and is a common cause of run-outs. The funnel shape also encourages the formation of a vortex, and, if the pouring be observed, a swirl may be seen on the surface even when the basin is quite full. Whilst this form of runner-basin is freely used in some foundries, it has little recommendation beyond its cheapness, and on investigation it will be found responsible for a good many wasters. It may be good enough for some jobs but it would be difficult for the management to discriminate what head box to use.

### Serviceable Form of Gating.

Fig. 5 shows the best form of gating for the great majority of castings. If we follow the course of the metal from the runner-head, the construction of the passages at each point is such as will give a quiet entry of the metal to the mould, and without much velocity, an entry at or near the bottom of the mould, and without splash. The in-gate should be placed at such a position that the metal will have a continuous and definite flow from the moment it enters the mould, entering at or near the thinnest portion, so as to have the hottest metal at the light section, and if a feeding-gate be considered necessary, this should be placed over the heavy section. In order to get these conditions, the down-gate from the basin is distinctly smaller than the down-gate in the drag or the in-gate to the mould. The down-gate from the cope discharges into a knob as also the down-gate in the drag.

These knobs serve much the same purpose as a dashpot to a governor; they control any sudden rush or irregularity, the object being to give a uniform and quiet flow. This saves many castings from scabs or pellets being shot all over the mould, chilling in their flight with a coating of oxide, from which state they do not usually melt again, but are found on the top of the casting. These pellets are generally considered to be due to phosphide eutectic.

### Cylinder Head Experience.

Here it may be well to relate an experience with several cylinder heads. These castings were so full of pellets they had to be scrapped, and on enquiry it was found that the gate had been put on the casting, the moulder's intention being to drop the metal between two cores; owing, however, to the gate not being straight, the metal had been playing against the corner of one of the cores, which shot the metal across the mould into pellets below a flange, most of them being trapped there. A great many of them came to the top of the casting, however, the iron used only showing on analysis 0.3 per cent. phosphorus, and the pellets gave just the same percentage.

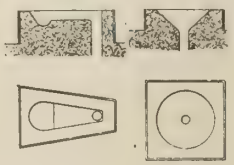

FIG. 3. IDEAL RUNNER BASIN.

FIG. 4. BAD RUNNER BASIN.

Gates made in the way just described give good results in regular practice; but they are in direct opposition to the contentions of many authors on foundry work, who, however, do not always state their reason.

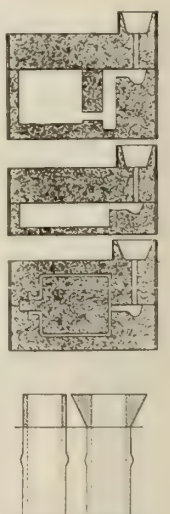

FIG. 5. IDEAL GATING.
FIG. 6. GENERAL FORM OF GATING.
FIG. 7. GATING HINDERING FREE ESCAPE OF GAS.
FIG. 8. HEADERS GIVING SAME METAL PRESSURE.

### Miscellaneous Service Gating.

Fig. 6 shows the class of gate as used for moulds generally, and, when choosing this type, consideration must be given to the depth of mould and bulk of metal. If danger be anticipated from high drop of metal into mould, Fig. 5, gate should be used. It is, however, desirable to retain the knob, and the down-gate should form the controlling area for the reasons already given.

In the case of a silencer for internal combustion engines we have a casting covering a considerable area and casting covering a considerable area and having an exceptionally large core compared with the bulk of metal. If the whole of the gas and air from the core has to escape through the branch at the end, the down-gate has to be comparatively small so as to fill the mould at such a rate as will allow the gas to escape. To counter-balance the cooling effect of the large exposed area, the metal has to be cast as hot as possible.

Again, we may have a mould with a thin section of metal and containing several small cores, each having points of connection through which the gas and air can escape. Here we have to provide for the large cooling influence of the cores, and so the casting has to be run sharply with hot metal. A quick cast in such cases is permissible because of the facilities for venting, which allow the air to escape as it is chased in front of the rising metal.

Balance-weights and hammer-blocks should be cast with a large gate. If this class of work is not cast smartly, the top of the mould runs the risk of being drawn down, due to long exposure of heat while the mould is filling.

Solid pieces are better cast with an in-gate three or four times the size necessary to fill the mould, and the rate of filling regulated by a plug in the runner-box. This will be found to feed most castings without the use of a rod through the riser.

No rule can, therefore, be laid down governing the area of gates: this is a matter which must be left to experience. Some moulders, after considering the design, weight, and area of a mould, will say that it should be cast in, say, 40 seconds or 1 minute, and on this basis the area of gate may be arrived at approximately.

### Surface Blackening of Runner-Gates.

The whole surface of runner-gates and sprues should be carefully blackened. If in long down-gates the ordinary swab cannot be got to the bottom, it must be fastened to a rod. Should this precaution be not observed, the gates will be scabbed, indicating where patches of sand have been washed into the mould. The cause of many otherwise mysterious defects will be located by an examination of the gate before it is broken off the casting. It is remarkable the number of experienced moulders who will neglect this most important detail by blacking the mouth of the gate only.

As to risers and headers generally, it will be found that moulders incline to

the belief that a comparatively big quantity of metal at the top is an advantage. If, however, the runner-basin and gates are properly made, very little dirt will have to be accounted for. A few extra inches will be found as good as a foot, and so the only other advantage that may be expected is to so construct the head that this will be the last part of the metal to set, and thus the feeding-rod may be used to the best advantage. The pressure due to the extra depth of metal, whilst a distinct advantage, is no more than will be obtained by an ordinary feeding-plate of equal depth.

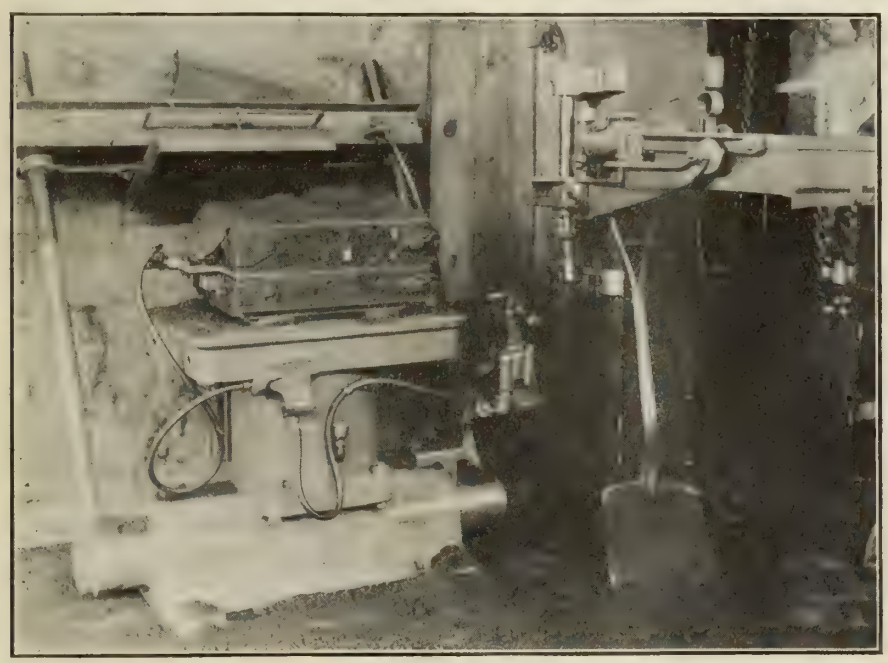
Some foundrymen do not appear to have sufficient confidence in their hydrostatic knowledge to say that the pressure due to the head is the same in both cases, Fig. 8. In the right hand sketch, however, there is a considerable amount of metal in bulk, often amounting to one-half the weight of casting required. This large bulk of metal will remain fluid long after the bottom portion has set, thus proving a real disadvantage, not only increasing the cost, but by the slow rate of cooling, allowing the carbon to separate out in large flakes, making the top of the casting more open.

## PNEUMATIC SIFTER FOR MOLDING MACHINES.

MOLDING machine users will doubtless be interested in this latest type of pneumatic sifter. It swings on a vertical shaft, which is held in brackets fastened to a wall or post, and is furnished with an automatic valve which admits air to the cylinder for starting the machine as it swings into place over the flask, and cuts off the air when swung back out of the way, this operation being almost involuntary on the part of the molder.

The screen box is rectangular in shape and arranged so that screens of different meshes can be used. The wire cloth is slipped into a space between two angles and securely held in place by a cap screw and washer in front of the screen box, thus providing an easy means for changing the screen. It can be dumped and cleared of the coarse material by lifting one end off the frame, while the other end swings on two bolts. When in operation, the loose end of the box is held in place by a spring catch.

This shaker will be found convenient for applying facing sand, the screen box containing enough sand for several molds, thereby avoiding the fatigue incident to lifting the full riddle above the flask for each mold when riddling by hand. The machine is furnished with screen box, either 9 in. wide by 12 in. long, 12 in. wide by 14 in. long, or with screen holder to accommodate an 18-in. riddle. The Hanna Engineering Works, Chicago, Illinois, are the manufacturers.



PNEUMATIC SIFTER SHOWN DRAWN BACK, READY TO SQUEEZE MOLD.

## SELECTION OF EMPLOYEES.

IN a talk on "First Aid" before the Newark, N.J., Foundrymen's Association recently, Dr. Henry Satchwell, of that city, emphasized the need on the part of employers to give more and stricter attention to selection of their employees, as nearly all accidents give opportunity of liability claim being made against them. He said:

"All workmen should be subjected to medical examination, in order that all hidden defects, either physical or mental, shall be known in advance. Injury by accident to the normal workman is a small factor; by far the greatest loss is from accident to the diseased man. If a sick man is well enough to get work, but is afterward injured, the employer is totally liable; therefore, the great importance of selecting labor. It will save more money than all subsequent economies. In foundries, where a great part of the work is heavy, ruptures are the bugbear. Heart disease, weak arterial walls and similar deficiencies incapacitate a man for such labor.

"The proper reporting of accidents is a duty that all manufacturers should require. It serves more than one purpose. It gives the employer a chance to check up false claims and to apply the right treatment at the earliest possible moment. Regulations for reporting accidents are almost worthless unless a penalty is attached to the failure to report.

"It has been found that factories that pay well both in wages and in medical treatment have the least trouble. It has been suggested that if the careful inspection of employees should be carried out, a large class of workmen would be unable to find employment. This would call for a legislative remedy, one that would enable a company to hire a man without being liable for disability caused or contributed to by some existing disease of the man."

## SUBSTITUTE FOR WOOD IN PATTERN-MAKING.

A COMPOSITION that has many advantages over wood for small patterns can be made as follows With hot water mix into a thick paste three parts by volume of starch, one part ground glue, two parts fine resinous sawdust. The sawdust should not be added until the starch and glue have been dissolved by the water. After the ingredients are thoroughly mixed, heat the whole to 190 degs. Fahr., and continue the heating until the whole become a hard mass, then allow to cool and remove from the receptacle. The resulting composition is a strong, hard, horn-like substance that can be machined, sand-papered, and varnished the same as wood.

The principal advantage of this composition over wood lies in the fact that it has no grain, and, therefore, turned and complicated patterns made from it do not have to be built up or glued together. For the same reason it is easier to turn and machine, and offers a smoother surface when finished. It is also more fireproof than wood and not so readily affected by atmospheric changes.

# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## HEAVY SPIRAL MILLING ATTACHMENT

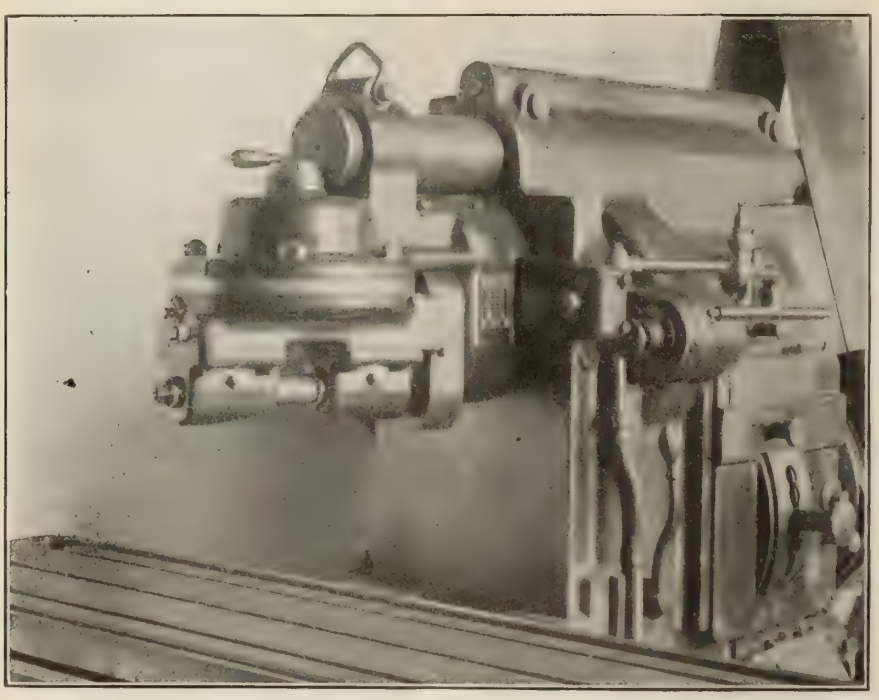
A RECENT addition to the extensive line of milling attachments manufactured by the Brown & Sharp Mfg. Co. of Providence, R. I. is a spiral milling attachment designed for the heavy class of spiral cutting. This attachment which is used in combination with a spiral head, is made in four sizes, making it adaptable to practically the entire line of plain and universal milling machines manufactured by the Company.

The illustration shows the attachment in place on the machine, from which it will be noted that the method of clamping to the overhanging arm as well as to the face of the column insures rigidity, and makes the attachment practically a part of the machine. To facilitate handling, provision is made for fixing a hook at the top of the attachment.

The spindle is hardened, ground, and runs in phosphor bronze boxes having means of compensation for wear. It is driven from the machine spindle by hardened steel spur and bevel gears, and can be set at any angle in a horizontal place, the position being indicated by graduations reading to half degrees. To insure rigidity and enable heavy cuts to be taken, the cutter spindle is provided with an outer bearing which can be easily removed when placing a cutter in position.

The inner spindle bearing is adjustable, the adjustment being made by a screw having a graduated dial on the front end of the attachment which reads to thousandths of an inch. This adjustment is valuable when setting the cutter central with the swiveling point, or when off-setting the cutter any definite amount. A suitable gauge is provided to enable the cutter to be set central with the swiveling point. This gauge slides in V ways on the attachment, a thumb screw clamping the gauge at any desired distance from the cutter spindle. The regular machine spindle speed change mechanism is used to obtain the different cutter speeds.

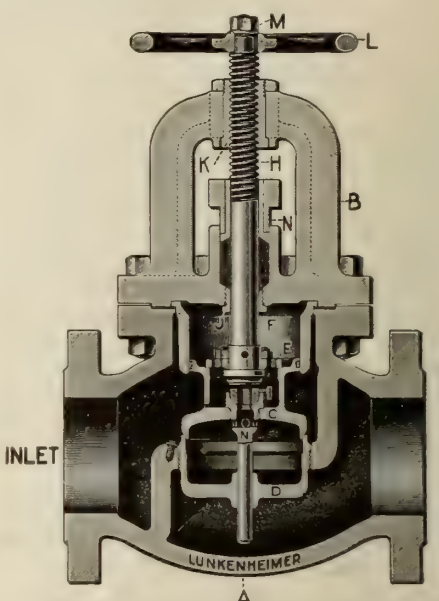
All gears and wearing surfaces are enclosed, preventing injury from dirt and dust as well as giving a neat and compact appearance.



SPECIAL MILLING ATTACHMENT FOR HEAVY SPIRAL CUTTING.

## IMPROVED BALANCED THROTTLE VALVE.

A VALVE of exceptionally free and easy operation combined with efficiency is, of necessity, required for engine throttle purposes, and that here described and illustrated was designed with this object in view. There are practically but three moving parts—the main disc, the by-pass disc, and stem—and these, being of large proportion, are likely to withstand the hardest service to which valves of this type are subjected. The operation of the valve is as follows:



IMPROVED BALANCED THROTTLE VALVE.

Assume that the valve is closed and under pressure. As pressure will enter the balancing cylinder, by passing the piston ring and through the small hole in the bottom of the disc cylinder, its amount above the disc is equal to that in the inlet of the valve. This pressure aids materially in holding the disc C tightly to its seat, but unless some provision was made to relieve it, the valve would be extremely difficult to open.

The method of relief lies in the by-pass I, the opening through which is covered by the bottom of the stem H when the valve is closed. A slight turn of the handwheel, however, uncovers this opening and the steam above the piston will then pass through the holes in the retaining ring E, thence through the hole in the by-pass disc I and holes in the main disc guide stem N, immediately relieving the pressure above the piston. Any pressure that may escape past the piston ring or through the small hole in the bottom of the disc cylinder is also quickly relieved while the valve is being opened. The main object of the small hole in the bottom of the disc cylinder, is to drain the water of condensation that may accumulate when the valve is connected in a vertical position, with the handwheel up. When in a horizontal position, any water in the disc and

balancing cylinders will drain past the piston ring.

Both the main and by-pass discs are operated simultaneously by one movement of a single handwheel, which not only facilitates the quick operation of the valve, but insures the opening of the by-pass valve at the proper time. Provision is made for regrinding both the main and by-pass disc seating surfaces, should they become worn, and as all parts are renewable, the durability of the valve is increased. Annual extensions on both the seat and disc provide spring seating surfaces.

The body may be tapped anywhere above the seat or inlet end for drain connection, so that any water from condensation can be removed before the valve is opened. For the lubrication of the engine cylinder, the body can also be tapped on the inlet or outlet end, to which lubricator connection may be made.

This valve is made by the Lunkenheimer Co., Cincinnati, Ohio, in sizes ranging from 4 to 10 inches inclusive. To suit various conditions of superheat and pressure and to meet the specifications of engineers who differ as to the materials used for the different parts, they are made in six combinations.

## MOTOR DRIVEN SPEED LATHE.

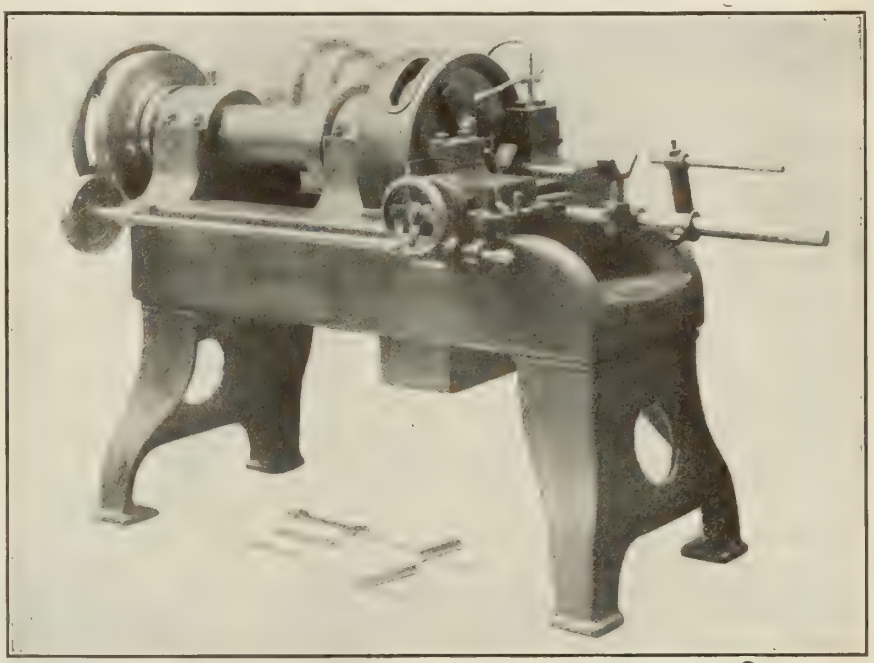
THE illustration and description refer to a motor driven speed lathe recently put on the market by the J. G. Blount Co., Everett, Mass. The style of motor drive with which the machine is equipped, employs a constant-speed motor mounted on a plate having an extension arm to support a bearing for the outer end of the motor shaft. The motor-plate is fitted to slide on a shelf securely fastened to the back of the lathe bed. This plate is operated by a screw which tightens and loosens the belt.

A four-step cone pulley is mounted on the motor shaft and belted to a four-step cone on the lathe spindle, which gives the same speed variation as a countershaft. By using various sizes of cones on the motor, wide ranges of speed may be obtained. The lathe spindle, which is made from high-carbon steel, ground to size, is hollow and bored for Morse taper. It runs in self-oiling bronze bearings. The tailstock has screw and lever feed; the bed is cross-braced, and the lever for operating the rest and tailstock is above the ways.

MOTOR-DRIVEN SPEED LATHE.

## CUTTING-OFF MACHINE FOR SHELL BILLETS AND FORGINGS.

THE W. P. Davis Machine Co., Rochester, N.Y., has re-designed its line of cutting-off machines, and brought out new models of the 4½-in. and 6-in. sizes. These machines are adapted to and are being employed in the cutting-off of billets and trimming the ends of shrapnel and lyddite shell cuppings when they come rough from the forges.



CUTTING-OFF MACHINE DESIGNED FOR TRIMMING THE ROUGH ENDS OF SHRAPNEL SHELL FORGINGS.

The 4½-in. machine has undergone some radical changes in design, while many improvements have been added to the 6-in. machine. The bed of the former is cast in one piece, thus insuring rigidity. The spindle is of hard, clean cast iron, and rests in anti-friction metal-lined bearings that are part of the main casting. The supports for the cutting-off slide consist of large pads which are cast on the frame, providing ample support for the slide and eliminating as far as possible all chatter. The end of the bed is open to facilitate the removal of chips, and the bottom is inclined to drain off the cutting compound.

On the spindle just behind the front bearing is a collar, through which project four round nose bolts, intended to support the work when the piece is too short to be gripped in the rear chuck. At the front of the spindle is a heavy pattern three-jaw chuck, and, at the rear, a quick-acting scroll chuck, operated by hand wheel. The cut-off slide is provided with two tools. It has power feed and automatic trip, which acts when the tools reach the centre of the work. A stock limit gauge is mounted on this slide, and two V-shaped sup-

ports are placed to catch the stock when it has been cut off.

Neither the 4½-in. nor 6-in. machines are provided with accelerating speed devices, as the four-step cone and double friction countershaft provide sufficient additional speed as the cutters approach the centre of the stock.

## PNEUMATIC BANDING PRESS.

THE pneumatic banding press shown in the accompanying illustration is intended for compressing the copper band on 18-pdr shrapnel and high-explosive shells. The action is such that the dies strike a sharp blow and then exert a heavy pressure sufficient to firmly force the copper into the dovetail groove.

The production obtainable is only limited by the ability of the operator to handle the work, the actual time required for the press to set the band on each 18-pdr. (3.3 inch) shrapnel shell being from 7 to 8 seconds. The production with one operator is easily one shell per minute, and with two operators it will run as high as 3 to 4 shells per minute. The machine is self contained, and, in setting up, it is only necessary to connect the shop air line to the control valve furnished with the machine. The air pressure required is 100 pounds per sq. inch; the floor space occupied is 30 in. by 30 in., and the weight 1750 pounds.

This press was designed by the engineer of the Chicago Pneumatic Tool Co., of Cleveland, Ohio, and is being marketed by the Motch & Merryweather Machinery Co. of that city. We understand an attachment for nosing 18-pdr. shrapnel shells and smaller has recently been designed which will make the press a double purpose unit.

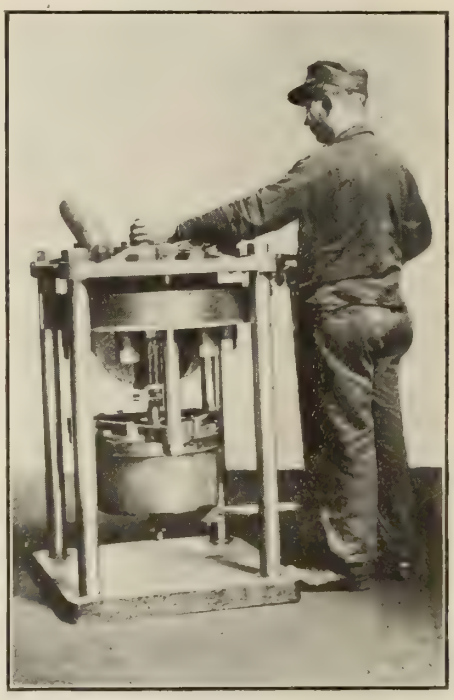
## ELIMINATION OF WASTE.

THERE is no doubt that in the vast majority of factories much time and labor is spent on work that is non-essential. Much of this non-essential work is unheeded because the relation between it and its place in the final product is not considered. For instance, the relation between the production of any detail part of a machine and the use to which the machine will eventually be put is just this—the finished detail is only important in so far as it assists in giving the machine those productive qualities desired by the user.

### The Drawing Office.

Consider the production of a complete machine from its inception to its installation in the user's shop. First of all there are the drawings to make. These drawings are not the final result desired; they are merely a means to an end and are essential only as indicators of the detail work required. Why, then, waste time in making a fancy border or beautiful copperplate lettering? If the drawing is correct, complete in its information and readable without straining the workman's eyes, it fulfils its purpose and any other work put into it is waste.

Much expensive pattern-making could often be saved if full consideration were given by the draughtsman to the making of the castings he designs. His usual practice is, however, to draw in a casting that will carry the shafts and other mechanism necessary, due regard being paid to its appearance but none to its production in the foundry. The result is often an expensive pattern with a multitude of loose pieces and the display of much annoyance, if nothing worse, by the moulder. A little knowledge and a little thought would have eliminated a great deal of such unnecessary work, which again can only be designated waste.



PNEUMATIC BANDING PRESS.

### Lathe Work.

When the raw materials arrive in the machine shop, this waste of non-essential machining assumes very large proportions even in so-called well-regulated shops. Each individual workman has eyes only for his immediate job and does not comprehend it in relation to its ultimate function in the finished machine.

Take, as an example, a fast-running shaft with two bearings and a drive fit to carry a gear. Such a shaft is to be ground for accuracy after turning. All that the turner usually considers is the production of what he calls a "nice lathe job." This is all very well, but it necessitates an extra finishing cut, when one roughing cut would leave the shaft in a much better condition for the grinder to handle. Then why waste time over the finishing cut? It is not essential, it is waste.

### Grinding.

Again, considering the same shaft, the bearing portions must of necessity be smaller than the bushes in which they run. It has been found after much painful experience that the limits for such bearings can be much wider than was previously considered permissible with beneficial results to the running of the shaft; no less beneficial is the shortening of the grinding time by imposing those wider limits. It may sound well to be able to say that shafts are ground to limits of half or quarter thousandths, but such boasters are often condemning themselves as waste producers.

The closer the limits, the longer the time required to grind. A bearing can be ground to limits of .001 inches in far less time than would be required for limits of .00025 inches. Extreme accuracy and close limits are often insisted upon where they are non-essential; the extra time spent in working to such a standard is therefore waste. The toolmaker is one of the worst offenders in this respect. He takes an inordinate pride in producing a nicely finished tool or jig, carrying his pride so far as to file and polish parts that do not require it, or working to extreme accuracy on dimensions that are unimportant.

A good casting needs very little or no filling before painting, and the excellence of its surface indicates that the metal is sound. Beware of superfluous or artificial finish: it is non-essential and therefore waste; it may indicate that there is bad workmanship to hide.

### Shop System.

Another aspect of this question, where waste often runs riot, is shop system. The great danger with many systems is that they tend to become more essential in the minds of those responsible for them, than the end to which they are, after all, only the means. In many factories to-day, there is too much signing of tickets and cards. Records must be kept, but they should also be kept in subordination. The works do not exist to carry out the system, the system exists to guide and record production.

Do not pin all your faith on the economies to be obtained by installing new methods; consider first of all where waste can be eliminated in the old methods.—Herbert's Monthly.

**Armour Piercing Shells.**—Shells for armour piercing are now fitted with a soft steel cap which, when the shell hits the armour, is forced back and at the same time stretched until it forms a ring through which the shell passes into the armour.

## "SHELLS, AND SHELLS, THEN MORE SHELLS."

THE announcement that all contracts in the hands of the Dominion Shell Committee on behalf of the British War Office have been placed has come upon our engineering and metal working plants administrations as somewhat of a surprise. Most of us during recent months had become disabused of the idea that the war was entering on its closing stages, and had unhesitatingly expressed the opinion that the combatants had not more than developed elementary, although essential campaign preliminaries. We were of course supported in our diagnosis of the situation by the wide publicity given to the matter of shrapnel and high explosive shell shortage, and by the incessant and wholesale blackguarding of the British operative because of his apparent lack of appreciation of the necessities of the situation.

Making all due allowance for the large-in-quantity and widespread-in-distribution contracts placed in Canada, many of which have not yet reached the production stage, at least so far as the high explosive shell is concerned, there is not a little concern being evinced—it may perhaps only be curiosity, as to further orders when those on hand are filled, and the war still raging. We have on previous occasions hinted at our shell-making industry as being a stop-gap proposition—until the British plants had established, extended and equipped themselves on a war-time basis, and color has been lent in recent days to such a possibility by the ease and facility with which our mechanics are being drawn away from our shores. The situation is indeed an interesting one, and may become intensely so very quickly.

Since the outbreak of this devastating European war, all sorts of interesting situations have arisen and the most unlooked for developments have taken place. Not the least of these latter was the decision to manufacture shrapnel shells in Canada. Experiment proved that we could, and the experience of the past few months has established the fact that our engineering and metal working plants can produce shells on a scale commensurate with manufacturers elsewhere on an equivalent opportunity basis. We are still of opinion that the war will be a long one—just how long, however, it were idle even to hazard a guess. That many more, and larger than ever, shell contracts will be placed with our machine shops, admits, we believe of no contrariwise opinion, and practical exemplification of this view is to be had in the almost mushroom growth of new factories and of extensions to those already existing; the avowed purpose being the production of "shells, and shells, then more shells."

A hitherto unrealized appreciation of the requirements of our Empire and her Allies in the matter of shells has now been grasped, and the timidity previously in evidence relative to investment of capital in plant additions and equipment has disappeared. What seemed a month or two ago as "long odds" in breaking even on capital outlay has developed into a "sure winner," and the only uncertainty, if such now exists, is the amount of the "purse" to be obtained. Intuitively, big things are not only expected, but are believed to be in process of development as regards shell manufacture in Canada.

The work of our Shell Committee has been no sinecure and of course in no such circumstances could it or will it be. Their experience is now of inestimable value, both to our own and the Imperial Government. A real measure of our shell production capacity has been secured and our aptitude to quickly develop and increase it has been specially noted. War-time expenditures of money always relate to millions, likewise the expenditure of ammunition. Viewed in the light of our Empire requirements, present and prospctive, and having regard even to the fact that shell orders placed by our Shell Committee have already gone into three figures of millions, it may, when peace again reigns among the nations, be found that the orders for British shrapnel and high explosive shells, and for which all contracts on hand are presently let to our manufacturers, constituted but a forerunner of many similar orders.

# The General Market Conditions and Tendencies

**This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.**

**Toronto, Ont., June 24,1915.**—The general situation is much the same as last week, the manufacture of shells being the most interesting feature in industrial circles. The expenditure on shells represents more money distributed than for any other single product, and indications point to an increase in the appropriations for this purpose. The importance of the shell industry is being more fully realized and orders for shells from the French and Russian Governments will probably be placed direct with Canadian manufacturers. This business in addition to the Shell Committee contracts will be a source of additional interest to the firms engaged upon this work. Foreign business is developing in other lines also. The Russian and French Governments have placed large orders for cars with the Eastern Car Co., and further interesting business is in sight. The Canadian Locomotive Co., have received an order for locomotives from the Russian Government which will keep the plant busy for some months. The British Government has appointed a representative to supervise contracts placed in Canada and the States, the result will probably be that more contracts for war material and supplies will be placed in Canada than heretofore.

### The Steel Market.

The most interesting feature in the steel market continues to be the shell business for which the tonnage is steadily increasing. Orders for 4.5 high explosive shells are being distributed in greater numbers and the making of 60 pounder shells is under consideration. A large order for high explosive shells for the French Government is ready for distribution and further Russian contracts will no doubt be placed with Canadian plants. As regards domestic requirements, the steel trade is certainly dull but the prospects for business resulting from the war are much brighter and may develop substantially; in some lines an improvement is already noticeable. A little heavier tonnage in reinforcing bars is reported and there is a better enquiry for bridge sections. The building trade continues dull, generally speaking, and there is a corresponding light demand for structural shapes. Prices on bars are firm but unchanged.

Another advance in galvanized plates has been made due to conditions in the spelter market. Although spelter has fallen, there has been little improvement in the situation. The price is still far too high to suit the galvanizing trade, and galvanizers are staying out of the market. The present abnormally high prices are expected to prevail until the demand declines considerably. Galvanized sheets have advanced $1 per cwt; prices are given in the selected market quotations.

The steel market in the States continues to improve both in tone and in tonnage. War orders are on the increase and domestic business is improving. Large orders for rails and cars from the Russian and French Governments have been placed with American plants, while Russia has also ordered a large number of locomotives. Prices of steel products are very firm and billets have made a slight advance.

### Pig Iron

There is no change in the pig iron situation. Business continues quiet and prices unchanged.

### Scrap Metal

Prices of copper and brass scrap are very firm at the advance announced last week. Lead and zinc on the other hand are weaker and declining. The active demand for copper and brass scrap continues but other metals are quiet. Heavy lead is now quoted at 5c, tea lead at 3¾ and zinc at 14c per pound. The iron and steel scrap market is quiet and unchanged.

### Machine Tools

Machinery dealers report very brisk business, the only trouble being difficulty of obtaining anything like satisfactory deliveries. The situation in this respect is getting worse rather than better, and orders are being held up on this account. With more firms continually going into the shell business and makers of tools working night and day, this will give an idea as to difficulties that have to be faced. Second hand tools are in great demand and also tooling fixtures for making shells. Prices of certain machine tools have advanced as much as 20 per cent since the beginning of the year due to increase in wages and manufacturing costs. The labour situation is causing some uneasiness, for, in the addition to a shortage of tool makers, a considerable number of men have left or are leaving for the Old Country to work in shell plants there.

### Supplies

The supply business is brisk on account of the shell business. There is a good demand for tool steel, belting, cutting compounds and waste. Solders have all advanced in sympathy with the tin market, and Manila rope is higher being now quoted at 16c per pound base. Red lead is unchanged but may advance again if the market for pig lead holds at the present level. Prices of brass goods are very firm but unchanged; makers are waiting developments in the metal markets.

### Metals

Spelter and lead are the only markets which have declined although copper has a weak tendency. The tin market is firm but quiet and antimony is dull but showing no signs of weakness. Business in metals for munitions is very active but ordinary business is quiet although there are indications of some improvements.

**Tin.**—The market is steady at the advance reported last week. Since the good buying movement of two weeks ago, the large consumers have shown little interest. Local quotations are unchanged at 45c per pound.

**Copper.**—The copper market is dull with a weak tendency. The consumption of copper continues heavy and the position is a strong one. Quotations are unchanged at 21c per pound.

**Spelter.**—The reaction in the spelter market continues and lower prices have been reached. The market is dull and unsettled and the situation cannot be said to have improved. Consumers are staying out of the market and are showing no interest in any position. It is suggested in some quarters that the market has been manipulated but the falling off in demand may be the reason for the decline. Spelter has declined 2c and quotations are nominal at 26c per pound.

**Lead.**—The market has reacted, the Trust having reduced their price to the basis of 6c at New York. The advance last week was apparently not justified, and it is suggested that the Trust reduced their prices to discourage speculation. The market is unsettled and has a weak tendency. Lead has declined ½c and is quoted locally at 7½c per pound.

**Antimony.**—The market is dull but there are no signs of weakening. The antimony position is serious as there is a prospect of increased demand with difficulty in obtaining supplies. Quotations are nominal at 40c per pound.

**Aluminum.**—The market is strong and advancing. Local quotations have advanced 6c and are entirely nominal at 30c per pound.

---

**St. John, N.B., June 19, 1915.**—The war has proven a benefit to those interested in the development of antimony mines, and there has been renewed activity by the Canadian Antimony Co., at Lake George, Prince William, York,

### COMING CONVENTIONS.

**Associated Advertising Clubs of the World, Chicago.—June 20 to 24.**

**American Society of Mechanical Engineers, Buffalo, N.Y. (Spring Meeting.)—June 22-26.**

**American Society for Testing Materials, Hotel Traymore, Atlantic City, N.J.—June 22-26.**

## Combined Manufacturing and Tool Room Grinding Machine

Combining as it does both an **external** and **internal** grinder, its field of usefulness is practically unlimited. It is especially adapted to tool room service, for finishing such work as **straight** and **taper** spindles, arbors, rolls, male and female gauges, dies, reamers, plain angular and forming milling cutters and a large variety of other work which can be held by either a face plate or chuck.

As a manufacturing proposition for accurately finishing straight or taper parts—external or internal—they assure accurate and economical production.

They will grind practically everything which can be turned on the lathe.

Canadian Agents—A. R. Williams Machinery Co., Toronto ; Williams & Wilson, Montreal

N.B. The directors of the company met in St. John this week in annual session. A proposal to lease the mine to a syndicate for a period of four years was received, while there was said to be also a possibility that a sale of the mine would be made to a company desirous of carrying on operations. Prospects are particularly encouraging for the establishment of the industry which affords employment to about seventy-five men.

Officers were elected at the meeting, as follows:—A. R. Slipp, M.P.P., K.C., of Fredericton, N.B., president; W. J. Francis, Montreal, vice-president; H. A. Porter, St. John, secretary; C. N. Crowe, Bridgewater, N.S.; F. W. Fairman, Montreal; H. Lindsay, Halifax; and Dr. W. J. Irvine, Fredericton, additional directors. Reports presented showed that when the company closed the mine in 1909 the price of antimony was only 6 cents a pound, while to-day it brings from 36 to 40 cents a pound. Managing Director Crowe was authorized to continue the negotiations for the sale of the mine, while the proposal to lease it for a four-year term was also considered at some length. Action will be taken at a meeting to be held soon.

At a meeting of the Stove and Sheet Metal Dealers' Association this week in the Board of Trade rooms, recognition was made of the gallantry of Lieut.-Col. J. L. McAvity and Major Sturdee in going on overseas service from Canada. The former had occupied the position of president of the Association, and Major Sturdee had been secretary. Because of their service to their country, it was unanimously decided to have them still nominally hold their respective offices during their period of service, though the duties would be attended by others. Harold Wilson, vice-president, occupied chair in the absence of Col. McAvity, and D. J. Barrett acted as secretary pro tem.

From the factories, offices and stores of the firm of T. McAvity & Sons, Ltd., St. John, thirty-nine men have given up their positions for the time being to serve King and country, some now overseas, in France or England, some others getting ready to go. An honor roll has been prepared, showing the names of the volunteers in alphabetical order as follows:—W. R. Allan, Lloyd Bradshaw, Edgar Brown, Wm. Burton, Fred. B. Campbell, B. H. Colpitts, Allen C. Coster, Arthur Crayton, J. T. Davidson, Chas. I. Dunfield, Harold Duplissea, Louis Gallagher, Harry Gibson, Anthony Howe, Ernest Jenkins, George Kelley, Fred. Marshall, Frank J. Murphy, Jas. L. McAvity, P. D. McAvity, Ronald A. McAvity, T. Malcolm McAvity, Chester B. McBay, George McNutt, Alex. Nesbitt, Chas. Noddin, Geo. North, Daniel Oram, Gus. Salamson, Wm. Scribner, L. G. Seeley, Wm. Smith, Albert V. Sowery, Geo. Spinney, Fenwick Tait, James Telfer, John K. Trifts, John Varnon, Lee Vincent. Included in this showing of volunteers are members of all ranks from private to lieutenant-colonel.

# CANADIAN COMMERCIAL INTELLIGENCE SERVICE

**The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Comissioners and Commercial Agents should be kept supplied with catalogues, price lists** discount rates, etc., and the names and addresses of trade representatives **by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.**

## Engineering

**Pembroke, Ont.**—The T. Pink Mfg. Co. are making shrapnel shells.

**Sidney, N.S.**—The town is in the market for 23,000 pounds of lead.

**Halifax, N.S.**—The machine shop of T. Hogan & Co. has been destroyed by fire.

**Medicine Hat, Alta.**—The Dominion Harvester Co. are equipping their plant for making shells.

**Barrié, Ont.**—The Canada Producer & Gas Engine Co. are negotiating a contract for shells.

**Windsor, Ont.**—The city council propose purchasing a boiler and equipment for the pumping station.

**Renfrew, Ont.**—The Renfrew Machine Co. plant was damaged by fire recently to the extent of $3,000.

**Hamilton, Ont.**—The Canadian Hart Wheel Co. contemplate the erection of an addition to their factory, estimated to cost $3,000.

**Bridgewater, N.S.**—The Acadia Gas Engine Co. are making considerable extensions to their plant and will install new machinery.

**Bridgeburg, Ont.**—The Tuttle-Bailey Co. and the Flanders Mfg. Co. have been awarded contracts for making shells for the French Government.

**Kelowna, B.C.**—The installation of a hydro-electric plant is being considered by the council. DuCane, Dutcher & Co. of Vancouver, are the engineers.

**Kincardine, Ont.**—The Hunter Bridge and Boiler Co. is fitting up the old Fisher foundry and will install the new machinery necessary for the manufacture of shells.

**Sherbrooke, Que.**—The city council are considering installing a gas plant at an estimated cost of $70,000. Ald. Brault is chairman of the Gas and Electric Light Committee.

**New Toronto, Ont.**—The New Toronto Cider Mill which has been vacant for over two years, has been purchased by an American firm and will be used for the manufacture of munitions of war, principally shells. Extensive alterations are being made and a quantity of special machinery will be installed.

**Chatham, Ont.**—The plan to have shells made in the Defiance Plant has been endorsed by the Board of Trade and the city council was asked to give special consideration to any firm or persons who would use the plant for such purpose.

**Cobourg, Ont.**—Work has started on a building for George Thompson for making shells. The machinery is being purchased and the plant will be ready shortly. J. E. Chambers is the superintendent. Maclean, Stone, Robson & McCurdy of Toronto are interested.

## General Industrial

**Winnipeg, Man.**—A. E. Hilder proposes to establish a vitrified brick and tile plant here.

**London, Ont.**—A fire destroyed the factory of the Thompson Knitting mills. The loss is estimated at $20,000.

**CANADIAN GOVERNMENT PURCHASING COMMISSION.**

**The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George Gault, Winnipeg; Henry Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.**

**Walkerville, Ont.**—The Peabody Mfg. Co. factory was damaged by an explosion of dynamite on June 21. The damage is estimated at $10,000.

**Stanstead, Que.**—Loomis, Dakin & Co. have commenced work on the new Butterfield factory. The contract calls for one building 60 x 160 feet, three stories and basement, another 60 x 145 feet, one storey and basement. The walls will be of solid brick and steel, the foundations and floors of concrete.

**Edmonton, Alta.**—T. H. Gilmour & Co. of Winnipeg are making inquiries in this district regarding the establishment of a manufacturing plant. It is stated that the company for whom they are acting would be prepared to spend $350,000.

**Chatham, Ont.**—It is announced that as soon as an agreement has been reached with the C. P. R. regarding a spur line to the site purchased by the Dominion Sugar Company work will be started on the construction of a refinery. A by-law will be voted on to raise $18,500 towards payment for the site.

## Municipal

**St. Catharines, Ont.**—The council contemplate installing an incinerator.

**Orillia, Ont.**—The Provincial Board of Health has approved of the scheme to install a mechanical filtration plant.

**Edson, Alta.**—It is proposed to spend $10,000 for fire protection apparatus. A by-law will be submitted on June 29.

**Ottawa, Ont.**—Preparations are being made to call tenders for the overland pipe. J. B. McRae is consulting engineer.

**Kingston, Ont.**—The by-law to authorize the expenditure of $,7,000 for the proposed incinerator was passed on June 21.

**Hamilton, Ont.**—Kerry & Chase, Ltd., engineers, of Toronto, have prepared a report on the proposed reservoir on the mountain top.

**Chatham, Ont.**—W. G. George, of this town, is preparing plans for a pumping and drainage system for Chatham Township Council.

**Guelph, Ont.**—Extensions are contemplated to the water supply system. The Provincial Board of Health has approved of the plans.

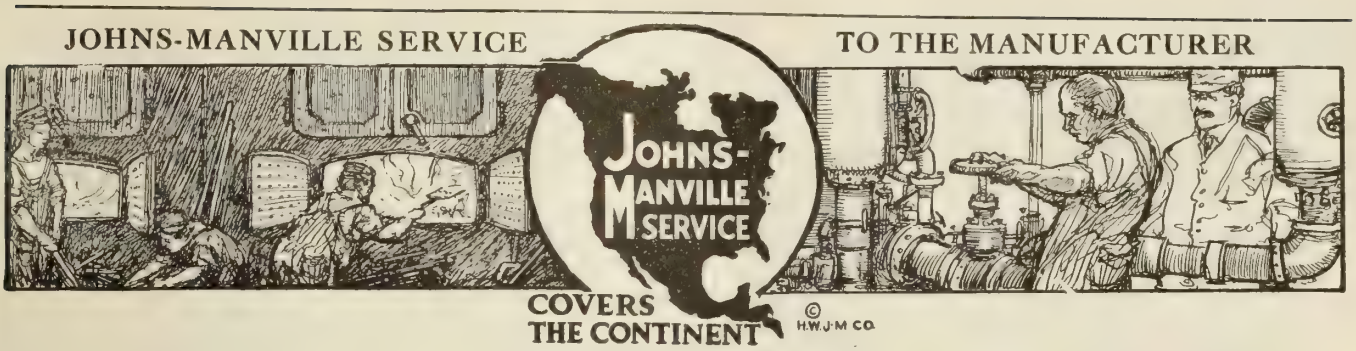
**Watrous, Sask.**—An expenditure of $42,000 is contemplated to complete the waterworks system. A by-law will be voted on shortly.

**Verdun, Que.**—The city council propose making extensions to the waterworks and electric lighting systems. Geo. A. Ward, secretary-treasurer.

**Penticton, B.C.**—Extensions will be made to the electric light system at a cost of $6,000. A by-law to authorize this expenditure has been passed.

**Peterboro, Ont.**—The ratepayers will vote on a by-law on July 6 to authorize the purchase of a site and the erection of an electrical sub-station, waterworks office and storehouse. Estimated cost, $50,000. S. R. Armstrong, clerk.

JOHNS-MANVILLE SERVICE TO THE MANUFACTURER



EVERY product sold under this emblem is backed by J-M Responsibility — a new order of Service pledged by a nation-wide organization that has had over half a century of experience in solving *your* problems.

J-M Products are made not merely to sell but to give satisfaction in use. Hundreds of J-M Service Representatives everywhere give this assurance. That's J-M Responsibility.

# Don't "Cover" Your Pipes—Insulate Them

*Cleveland Electric Illuminating Co., Cleveland, Ohio.*

The only insulation for hot or cold surfaces that you can afford to consider is that which will return the greatest interest on the investment. This interest is computed upon the saving in the fuel bill and general increased efficiency.

J-M Service seeks the opportunity of making an investigation of your individual requirements and of recommending insulation best suited to your particular needs. Also, to prove to you by facts and figures just what saving we can accomplish for you.

There is no problem in the field of hot and cold insulation that we cannot successfully take care of.

Tell our salesman of your insulation requirements. You will be given the service of our staff of insulation experts without obligating you to anything but a fair consideration of our proposition.

Our line of coverings meets every requirement to be found in the problem of insulation.

# J-M Asbestos Roofings are not corroded by cupola gases and last for years without paint or repairs

Foundries, furnaces and shops all over the United States, roofed with J-M Asbestos Roofings, prove how durable these roofings are under the extreme service conditions to which every foundry roof is subject.

There is nothing in these roofings to corrode or break down under chemical attack, as they are of absolutely inorganic composition, made of Asbestos and Trinidad Lake Asphalt. Never need painting, so that first cost is their only cost.

## "Built-Up" for Flat Roofs

Smooth surface, with no loose material; much lighter than tar and gravel; practically fireproof and most permanent of all coverings for flat tops.

## "Prepared" for Slope Roofs

Your own men can lay this roofing—unequalled over wood sheathing on saw tooth and other slope roofs. J-M Roofing Cleats make waterproof seams.

*Central Foundry, Lathwood Foundry Co., Pittsburgh, Pa.*

*Let Us give You the Results of Our Experience in handling Roofing Problems such as Yours.*

# 3 BIG REASONS WHY YOU NEED

# PURO

(MADE IN CANADA)

1. Puro Sanitary Drinking Fountains will give you a *better* water supply *cheaper*.
2. Puro will cut your water bills 15% to 35%.
3. PURO will safeguard the health of your employes and raise the standard of efficiency.

Are not these reasons enough? Then why hesitate longer?

PURO equipment is not expensive—the first cost is *low* and the upkeep *nothing*. Easily attached; positively fool-proof.

Let us make you a special proposition for a try-out in one of your departments.

Write us now—to-day giving us the number of men; an inquiry will cost you nothing.

## "PURO-FY"

YOUR WATER SUPPLY

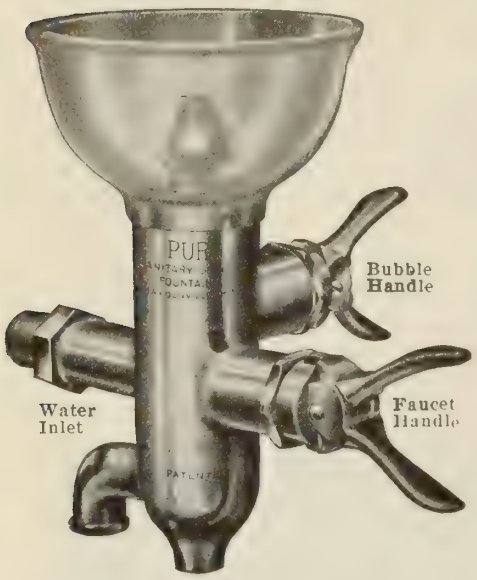
143 University Ave.
TORONTO, CANADA



KINDLY MENTION THIS PAPER WHEN WRITING ADVERTISERS

**Vancouver, B.C.**—Among the by-laws to be voted on by the ratepayers on June 28, is included one to raise $230,000 for waterworks improvements and extensions.

**Ailsa Craig, Ont.**—A by-law will be voted on by the ratepayers on June 28, to raise $7,729 to cover the cost of an electric power distributing plant.

**Ingersoll, Ont.**—The town council will submit a by-law to the ratepayers to raise $10,000 for repairs and extensions to the waterworks plant. W. R. Smith, town clerk.

**Peterborough, Ont.**—A by-law will be voted on by the citizens on July 6 to raise $50,000 to meet the cost entailed in the erection of equipment for the sub-station.

**Montreal, Que.** — Hering & Fuller, consulting engineers of New York, have reported in favor of making an addition to the water filtration plant now under construction. The additional unit would be of the mechanical filter type and would have a capacity of 50,000,000 gallons. The total proposed expenditure amounts to $4,500,000 which includes $1,500,000 for a pumping plant.

**Sarnia, Ont.**—As the result of a report submitted by Engineer Jeffrey, of the Ontario Hydro-Electric Commission, the city council will offer the Sarnia Gas and Electric Co. the sum of $155,000 for its plant and equipment, with the installation of Niagara power the object in view. If the company accepts the offer, as is expected, a Hydro-Electric by-law will probably be submitted to the ratepayers shortly.

## Electrical

**Petrolia, Ont.**—The town council are considering installing a hydro-electric system.

**Toronto, Ont.**—The Hydro-Electric Power Commission are in the market for a 350 k.v.a. 60-cycle alternator. Office is in the Continental Life Building.

## New Incorporations

**The W. A. Swayze Co.** has been incorporated at Toronto, with a capital of $40,000 to manufacture automobile, wagon and carriage bodies at Toronto. Incorporators—Elmer McLeod Rowand, Oscar Heuman King, of Toronto.

**The Universal Stove and Furnace Co.** has been incorporated at Ottawa, with a capital of $500,000, to manufacture stoves and furnaces, etc., at Toronto, Ont. Incorporators—George Mortimer Kelley, John Delatre Falconbridge, of Toronto.

**The Invincible Machine Co.** has been incorporated at Toronto, with a capital of $100,000, to carry on the business of machinists, mechanical engineers, toolmakers and iron and brass founders, at Toronto, Ont. Incorporators — James Young Murdoch, Esca Brooke Daykin, of Toronto, Ont.

**The Vacuum Street Cleaning Machine Co.** has been incorporated at Ottawa, with a capital of $175,000, to manufacture street sweepers, air cleaners, drying apparatus, etc., at Windsor, Ont. Incorporators—William Thomas Blaney, of Windsor, Ont., and George Samuel Clarke, of Detroit, Mich.

## Tenders

**Winnipeg, Man.**—Tenders, addressed to the Chairman, Board of Control, will be received up to Monday, June 28, for the supply and erection in place of vault fittings for the city clerk's office, in accordance with plans and specifications, copy of which may be obtained at the office of the city engineer, 223 James Avenue, Winnipeg.

**Kingston, Ont.**—Tenders will be received up to June 21 for the following work in connection with the civic incinerator: Contract A:—The supply and erection of a 36-in. circular steel stack. Contract B:—The delivery of a 75 h.p tubular boiler. Plans and specifications may be seen at the office of the City Engineer, R. J. McClelland.

**Hamilton, Ont.**—Tenders will be received by the chairman Board of Control, up to Monday, June 28, for the following works in connection with the Gage Ave. sewage disposal pumping station:—Roofing and sheet metal work, heating, electric lighting, steel roof trusses. Plans and specifications may be seen at the city engineer's office upon application, copies of which may be had on receipt of deposition of $10, which will be refunded on return of same.

**Ottawa, Ont.**—Tenders will be received until Monday, July 12, for the construction of the superstructure for a bridge, consisting of four spans, over the Quinze River at North Timiskaming, Pontiac County, Que. Plans and forms of contract can be seen and specification and forms of tender obtained at the Department of Public Works, Ottawa, and at the offices of the district engineers, Shaughnessy Building, Montreal, P.Q.; Confederation Life Building, Toronto, Ont.

# Refrigeration

**Quebec, Que.**—A company has acquired a site at Limoilou, near here, and will build an abattoir and cold storage plant. Contracts to the value of $25,000 have already been awarded for the construction of the plant. Lucien Trotter, of Normandin, is president, and Germain Gagnon, of St. Bruno, is manager of the company.

# Contracts Awarded

**Sidney, N.S.**—A contract has been awarded to Kerr & Co., of Walkerville, Ont., for valves for the new pumping station at a cost of $1,170.

**Sidney, N.S.**—The contract for the building of the new pumping station at Middle Lake has been awarded to Chappell Bros., Ltd. The amount of their tender was $13,023.60.

**Orillia, Ont.**—The Town Council has awarded the contract for switch-board and all cables and oil switch to the Northern Electric Co., Toronto, at $2,565, price to include erection.

**Redcliffe, Alta.**—The rolling mills here have secured the contract for the steel work on the large Centre Street bridge in Calgary. This work will require 500 tons of steel.

**Victoria, B.C.**—It is announced that the McAlpine Robertson Co. have been awarded the contract for the erection of the Dominion Government observatory on Little Saanich Mountain, the contract price being $75,000.

**Orillia, Ont.**—The Water, Light and Power Commission has awarded the contract for two 175 h.p. slip ring motors, 1,200 r.p.m., in accordance with specifications, to the Canadian Crocker-Wheeler Co., St. Catharines, at $3,100.

**St. Catharines, Ont.**—William Riley, of this city, has commenced work on sub-contracts for pile driving on sections 1 and 3 of the Welland Ship Canal. John Morley has also started his subcontract for drilling in the harbor at Port Weller. It is expected that the work will take nearly four years to complete. A quantity of excavation is also to be handled.

# Building Notes

**Ingersoll, Ont.**—It is proposed to spend the sum of $70,000 in the erection of a new sixteen-roomed school here.

**Winnipeg, Man.**—Tenders will be called for the erection of a new public

school to be built on the corner of Union Avenue and Gray Street.

**Fort William, Ont.**—The contract for the construction of a new registry office has been let to M. H. Braden, of this city.

**Baldwin's Mills, Que.**—W. K. Baldwin will build a sawmill to cost about $10,000. Transmission and woodworking machinery will be required.

**Fort William, Ont.**—M. H. Braden has been awarded the contract for the building of the new registry office here, by the Ontario Government. He will commence work on the foundations. The cost of the building is estimated at about $26,000.

**Sault Ste. Marie, Ont.**—The contract for the erection of a new jail building here has been awarded by the Minister of Public Works and formally signed. The building will cost $25,390, and will be built by McIntyre, Haining & Kelly, of Sault Ste. Marie. Plans for a new court house at the "Soo" are also nearing completion.

## Railways - Bridges

**Newmarket, Ont.**—A reinforced concrete bridge will be constructed near here at an estimated cost of $5,000. The York Township Council are doing the work.

**Hope, B.C.**—The Canadian Northern and the Great Northern Railways will construct terminal buildings, turntables, roundhouses, etc., here. The construction work will begin in a few weeks.

**Ottawa, Ont.** — Negotiations which have been in progress for a few weeks looking to the acquisition by the Government of the Lake Superior branch of the Grand Trunk Pacific are practically closed. On account of the bonded indebtedness of this branch being complicated with the main line of the G. T. P., a purchase outright was found impracticable. In place of it a long lease is being arranged. It is understood that the rental will be about half a million annually. The interest to be paid by the company is on bonds issued at the rate of $70,000 per mile.

## Marine

**Quebec, Que.**—Seven tenders have been received for the construction of the storage dam at La Loutre, on the St. Maurice River, for the Quebec Streams Commission. The dam will be over 1,000 feet long, and over 85 feet high at the deepest part. The area to

**Fordonian Breaks Crank Shaft.**—The steamer Fordonian, of the Canadian Steamship Lines, the only vessel on the Great Lakes of her size having Diesel engines, broke her crank shaft above above White Fish Point on June 17, just after finishing a trip across Lake Superior. She was picked up by the tug Schencke, of Sault Ste. Marie, and towed to Port Huron. She will probably be taken to Port Colborne for repairs.

**C. G. S. Montmagny Action.** — The Canadian Government has agreed to settle the action it brought against the steamer Lingan for $400,000 in conjunction with the sinking of the C. G. S. Montmagny, below Quebec, on Sept 8, 1914. The Montmagny was rammed by the Lingan, a collier, and sank, several of her crew and passengers being drowned. It is understood the Government has accepted one hundred thousand dollars. The action was to have been tried in the Admiralty division of the Exchequer Court.

## Personal

**E. J. Holland**, city engineer, of Guelph, Ont., has tendered his resignation to the Board of Works.

**R. H. Balfour**, of the Montreal Light, Heat and Power Co. has been appointed Chief Engineer of the Montreal Electrical Commission.

**Capt. E. L. Squire**, of the steamer Fernfield, fell overboard and was drowned on the night of June 11 while his ship was near St. Paul's Island, near Montreal.

**Capt. Holmes**, who had his master's certificate taken from him on account of his vessel, the Morwenna, coming into collision with a ferry-boat in Halifax harbor some months ago, has had it returned by the Minister of Marine. The Dominion Coal Co., which owned the Morwenna, employed the captain in a minor capacity, and he was on board that steamer when it was torpedoed by a German submarine recently off the coast of Scotland. In view of Capt. Holmes' conduct, the Canadian Minister of Marine has deemed it advisable to hasten the time of giving back to the captain his master's certificate.

**Machinery Merchants,**

Incorporated

50 Church St., New York City, N.Y.

Long Distance Telephone, Cortlandt 2278, 2279

**Halifax, N.S.**—The Eastern Car Co. has received a large order for cars from the French Government in addition to that from the Russian Government.

**The Rathbun Match Co.** has been licensed to carry on business in the Province of Ontario, with a capital not exceeding $40,000. Head office, Deseronto, Ont.

**Calgary, Alta.**—W. R. Martin will be managing director of the Canadian Western Foundry and Supply Co. The other officers will be W. H. McLaws, chairman; G. A. McKenzie and T. A. McAuley.

**The Ambursen Hydraulic Construction Co. of Canada, Ltd.**, Montreal, has been awarded the contract for the construction of two storage dams on the Nashwaak River, near Marysville, N.B., for the Edward Partington Pulp and Paper Co., Ltd., St. John, N.B.

**Halifax, N.S.**—The Nova Scotia Tramways and Power Co. have taken the first step to carry into effect the legislation enabling them to take over the properties of the Halifax Electric Tramway Co. and the Nova Scotia Light and Power Co.'s hydraulic powers on the Gaspereau. The petition asks first that the capital of the company be increased to $10,000,000.

**Quebec, Que.**—With a capital of three million dollars and extensive powers, a new company has been incorporated by Provincial Letters Patent to develop hydraulic powers in the cities of Quebec and Three Rivers and also in various counties in the district. All the promoters are located in Montreal and comprise: Charles H. Branchaud, Milton Lewis Hersey, Howard Murray, Thos. McDougall, and Julian C. Smith.

**Toronto, Ont.**—Sir Adam Beck, chairman of the Provincial Hydro-Electric Power Commission, recently announced that plans were being prepared for lines which would join seventeen more municipalities to that system. He stated, moreover, that fourteen other municipalities had been in communication with the commission and would ask their electors to vote upon by-laws authorizing their councils to contract with the Provincial Commission for supplies of electricity.

**Wheat Through Lachine Canal.**—Since the opening of navigation a little over twelve million bushels of wheat has reached Montreal through the Lachine Canal. This is over 1,500,000 bushels less than it was for the same time a year ago. Twenty-six vessels have brought grain, largely wheat, from United States ports, mostly from Duluth and Chicago. During the last month only four Amer-

ican grain carriers have arrived, but there were twenty-two in the early days of the season.

**Trade With Russia.**—Aemilius Jarvis, of Toronto, has just returned after an absence of about two months, during which time he visited France and Russia, as well as Britain. He spent some time in Petrograd and Moscow. Discussing the prospects of Canadian concerns securing orders from Russia, he said that it took time and pains. Credentials must be the very best, and the representative must in no way be a middleman. The Russian Government always demanded reasonable guarantee that tenderers were in a position to deliver the goods. Initial orders, however, if properly lived up to, would probably be forerunners of much business from Russia.

## Catalogues

**Drill Chips** for June published by the Cleveland Twist Drill Co., Cleveland, Ohio, has come to hand. Its feature this month is an interesting dissertation on co-operation with regard to the conduct of business as well as national affairs. There are also included a number of well drawn cartoons.

**Cutting-off Machines.**—Catalogue A-2 describes the new Davis cutting-off machines which are specially adapted for cutting off bar stock in the manufacture of shells. The various sizes in which this machine is made are illustrated and described fully with the principal dimensions given for each.

**Steam Traps.**—Bulletin G is devoted to descriptions of the various types of steam trap made by the Elliott Company, Pittsburgh, Pa. The principle of operation of the steam trap is first dealt with followed by a comprehensive detail of each type with special reference to their distinctive features. Illustrations and tables are included giving the principal dimensions for each type and size.

**Water Columns** made by the Elliott Company, Pittsburgh, Pa., are dealt with in bulletin H. recently issued. These water columns are of the alarm type and each pattern is described fully accompanied by illustrations showing the general design and distinctive features. A dimension diagram is shown for each pattern, and in conjunction are tables giving the principal dimensions.

**Pressure Oil Filter.**—The V. D. Anderson Co., Cleveland, O., have issued a catalogue describing their pressure oil filters. The filtering of oil is dealt with in a general way followed by a description of the Anderson process, its installation and operation. The various types

Grey Iron and Brass Castings,

Special Machinery Made to Order.

METAL STAMPINGS

We are manufacturers of stamped parts for other manufacturers.

We do any kind of sheet metal stamping that you require. Our improved presses and plating plant enable us to produce the finest quality of work in a surprisingly short time.

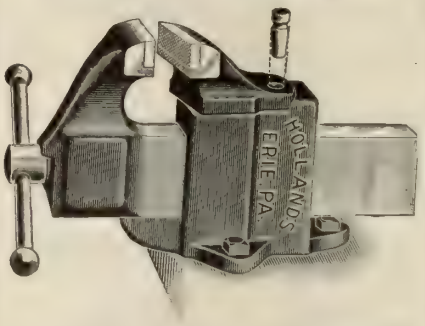
We can finish steel stamping in Nickel, Brass or Copper.

Send us a sample order.

W. H. BANFIELD & SONS

120 Adelaide St. W., Toronto

VISE EFFICIENCY



Hollands Vises meet the requirements of mechanics who demand the highest efficiency, combined with maximum strength and durability.

It is not economy to buy cheap vises.

Our Catalog No. 22 will explain why many of the leading industrial shops have used our vises for over a quarter of a century.

Hollands Mfg. Co.

Established 1887

Erie, Pa.

are described and illustrated and diagrams of typical installations are included. Other specialties described and illustrated are oil pumps, storage tanks, steam and air traps and water columns, etc.

**A New "Angle" on an Old Subject**, is the title of a bulletin issued by the Detroit Twist Drill Co., Detroit, Mich. The bulletin contains in the opening pages a good deal of useful information on the design and use of twist drills with special reference to the "Detroit" twist drill and its salient points. Other matter consists of a number of practical suggestions for users of twist drills including more useful pointers on grinding drills and speeds and feeds. The concluding pages contain a series of useful mechanical tables. The bulletin is fully illustrated.

**Steel Bridges.**—The Dominion Bridge Co., Lachine, Que., has issued a new catalogue, S-1, containing views of a large number of bridges of various designs erected in different parts of the country and also of various other steel structures such as buildings, water tanks, coal towers, etc. Several of the bridges are shown during construction and reference is made to the method in which erection problems have been solved. The catalogue indicates the development that has been made in bridge construction in Canada in recent years. The illustrations are excellent reproductions and a brief description accompanies each.

**Flow Meters** for measuring steam, water, air and gas are described fully in bulletin No. 46501 issued by the Canadian General Electric Co., Toronto, Ont. The Bulletin contains 47 pages devoted to matter relative to flow meters and the principle of operation. The construction and method of operation of each of the various types is described in detail accompanied by numerous illustrations showing the chief features of their design. The indicating and receiving apparatus are also dealt with fully, and the unit of calibration for each type is explained. The concluding pages contain list prices of the various types meters, nozzle plugs and pipe reducers, velocity tables, ordering instructions, and an index to subjects and list prices.

**Clergyman Makes Shells.**—A call for recruits in Glasgow to assist in the manufacture of shells brought forth a clergyman, who was promptly accepted. He is the Rev. Stuart Robertson, of Pollokshield Church, a tall, athletic figure, who now serves from 6 o'clock in the morning until 5 at night in a large engineering shop. His day's work over, the Rev. Robertson attends to his pastoral duties as his evening's recreation

# HINTS TO BUYERS

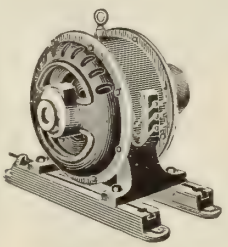
**WELLAND MACHINE AND FOUNDRIES**
**WELLAND - LIMITED - ONTARIO**

We specialize in Dies and Chills for forging Shells.

All kinds of Grey Iron and Semi-Steel Castings guaranteed clean and true to pattern.

HAND HOISTS, STRUCTURAL CASTINGS, ETC.

**Steam Hoisting ENGINES** **Special MACHINERY**



**Do You Need Motors?**

If so, write

## IS YOUR RIVETING PROFITABLY DONE?

Our Elastic Rotary Blow Riveting Machine does profitable work, because one machine will do the work of several hand riveters, and do it better.

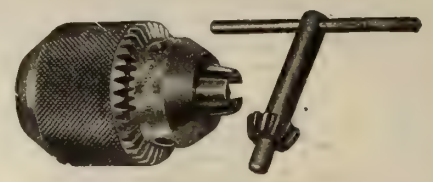
Every head is perfectly formed, any shape, round, flat, oval, rectangular, etc.

**Catalogue C tells more about it.**

**The F. B. SHUSTER COMPANY**
**New Haven, Conn.**
**Formerly John Adt & Son. Established 1866**

Also makers of Wire Straighteners and Cutter, Cotter Pin Machines, etc.

**What do you think about it?**



**Patented Sept. 16, 1902.**

More than 183,000 JACOBS IMPROVED DRILL CHUCKS have been purchased. Our customers of 1903 have since continuously and increasingly purchased JACOBS IMPROVED DRILL CHUCKS. More JACOBS IMPROVED DRILL CHUCKS were purchased during April, 1915, than during any previous month.

We think this record is the strongest possible evidence of the JACOBS IMPROVED DRILL CHUCK'S recognized merit, and our liberal, honorable dealings. WHAT DO YOU THINK ABOUT IT?

**Our new illustrated catalogue sent upon request.**

# BIG MEN

## have picked the

*Greenfield*

We can point with pride to the list of prominent concerns who have selected our UNIVERSAL GRINDING MACHINE for use in their works. Such a list would cover nearly all mechanical lines as well as many famous technical schools and colleges.

Why has the "Greenfield" been chosen?

Because it is simple and rigid in its design; is thoroughly well built; is equipped with a large assortment of practical and convenient attachments; and because it represents greater value in proportion to its cost than can be obtained elsewhere.

Don't purchase a grinding machine for tool room use without investigating what we have to offer.

We also build PLAIN CYLINDRICAL GRINDING MACHINES for production work.

## Greenfield Machine Company

## The Measure of a Drill

Pick out a drill—its looks, its price, count for little. The measure of a drill is—How many holes will it make?

### Cleveland Twist Drills

measure up because of their well known hole-producing qualities.

*Are you getting "Drill Chips" each Month? If not, ask for it.*

**The Cleveland Twist Drill Co.**
New York Cleveland Chicago

# Keep Moving

It is a physical fact that to *stand still* is more tiring than to *keep moving*. Inaction is enervating. Movement is stimulating.

Protect yourself against business inertia by the advertising movement. Retain your customer's confidence by a continued show of strength. *Keep moving* and advertise in

Canadian Machinery
143-153 University Avenue - TORONTO

# Stop This Waste

The money now **wasted** by **inefficient** files would pay Canada's whole file-bill —if files were used **right.**

The **right** way is to use a file **only** to the point where **efficiency decreases.** Beyond that point, it is **inefficient.** It **wastes time.** Enough to pay for **several** new files—and leave a margin of profit beside.

To stop **file-waste** on YOUR work—enforce the rule against **inefficient** files. See that your men **promptly** replace all worn files—and use only the "Famous Five":

**KEARNEY & FOOT**
**GREAT WESTERN**
**AMERICAN**
**ARCADE**
**GLOBE**
***(Made in Canada)***

Their **efficiency** reflects our **50 years' experience.** Their **uniformity** reflects our **complete control** of every manufacturing process. Their **economy** reflects the saving of our **60,000,000** yearly output. Their **popularity** reflects the QUALITY that holds **90%** of Canada's file demand.

**Stop file-waste. Turn losses into profits. Use only the "Famous Five." Catalog and "File Philosophy" FREE on request.**

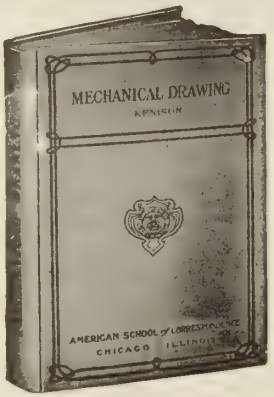
# Mechanical Engineering Books

If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.

**MACHINE-SHOP WORK.** By Frederick W. Turner, Instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price ...$1.50



**MECHANICAL DRAWING.** By Ervin Kenison, S.B., Assistant Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price ..... $1.00

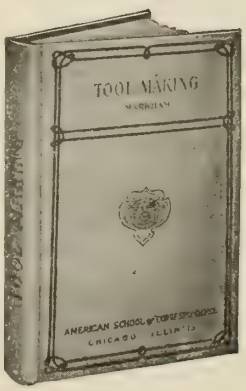
**FOUNDRY WORK.** By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 142 illus. Cloth binding. A practical guide to modern methods of moulding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price .....$1.00

**PATTERN MAKING.** By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price .....$1.00

**MACHINE DESIGN.** By Charles L. Griffin, S.B., Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price .....$1.50

**FORGING.** By John Lord Bacon, Eng. and Supt of Construction, with R. P. Shields & Son. San Diego, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working handbook of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price .....$1.00

**TOOL MAKING.** By Edward R. Markham, Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers, Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels —annealing, tempering, spring tempering, hardening, case hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandrels, taps, hobs, reamer and tap-holders, jigs, gauges, dies and die-holders of all kinds, counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price ..... $1.50



Sent postpaid on receipt of price. We can also furnish you with other standard works on Engineering in all its branches, including books for Civil Engineers, Contractors, Electricians, Foundrymen, Steam Engineers, Mechanical Engineers, Municipal Engineers, Railroad Engineers, Sanitary Engineers, Gas Engineers, Hydraulic Engineers, Technical Men.

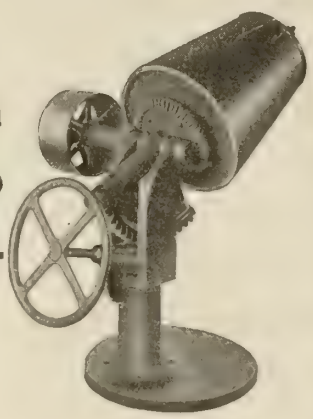
## Make One Barrel Do What Two Barrels Did Before



THE minute you install one Globe Tumbling Barrel you can pension two of your old-fashioned horizontal barrels and still do a wider variety of work—and do it a great deal better and many times faster.

GLOBE TUMBLING BARRELS

save time because they don't have to be stopped for filling, emptying or inspecting of the work. They save floor space, because they stand vertically and occupy little room—and they save money, because they require a smaller investment in barrels.

Eight stock sizes, $50 to $170. Our Booklet 2 contains useful information on tumbling — shows the different styles of Globe Barrels and tells what each will do. Write for a free copy to-day.

The Globe Machine & Stamping Co.
Cleveland, Ohio, U. S. A.

# Nova Scotia Steel and Coal Company, Ltd.

## BEG TO ANNOUNCE

That their new Steam-hydraulic Forge Shop is now in operation, as also is their recently installed "Harmet" Fluid Compression Plant.

These improvements bring "Scotia's" Equipment abreast of the best foreign forges.

They are accordingly open to supply forgings of all shapes and sizes, made of Best Ordinary or Fluid Compressed Open-hearth Steel, and satisfying the most severe specifications.

---

For prices and particulars apply to

**Western Sales Office, Room 14, Windsor Hotel, Montreal, Que., or Head Office, New Glasgow, Nova Scotia**

# No, Stevens' Stopper won't stop a train, but it will stop the blow hole in a defective casting so that you cannot find it.

In this way, it helps your bank account. The casting that otherwise would have to go to the scrap heap can be converted into good coin of the realm.

Same color as the rest of the casting. Doesn't look like a blue patch on Casey's faded overalls.

*How to use Stevens' Stopper, or Circle Cement:*

Stevens' Stopper is a fine powder, used with a little water and made into a paste—the hole is easily filled with a putty knife or trowel. It takes anywhere from two to twenty-four hours, depending upon the size of the patch, for the filler to become as hard as the casting itself. When rubbed with a file it shows the color of the casting, hence it is the best filler and the one thing that saves your castings, and that means the saving of your dollars.

Another thing—I do not ask a fancy price for it.

A pound will save many dollars' worth of castings. Put up in 5-lb., 10-lb., and 25-lb. cans.

## FREDERIC B. STEVENS

Manufacturer of
Foundry Facings and Supplies, Buffing Compositions and Platers' Supplies

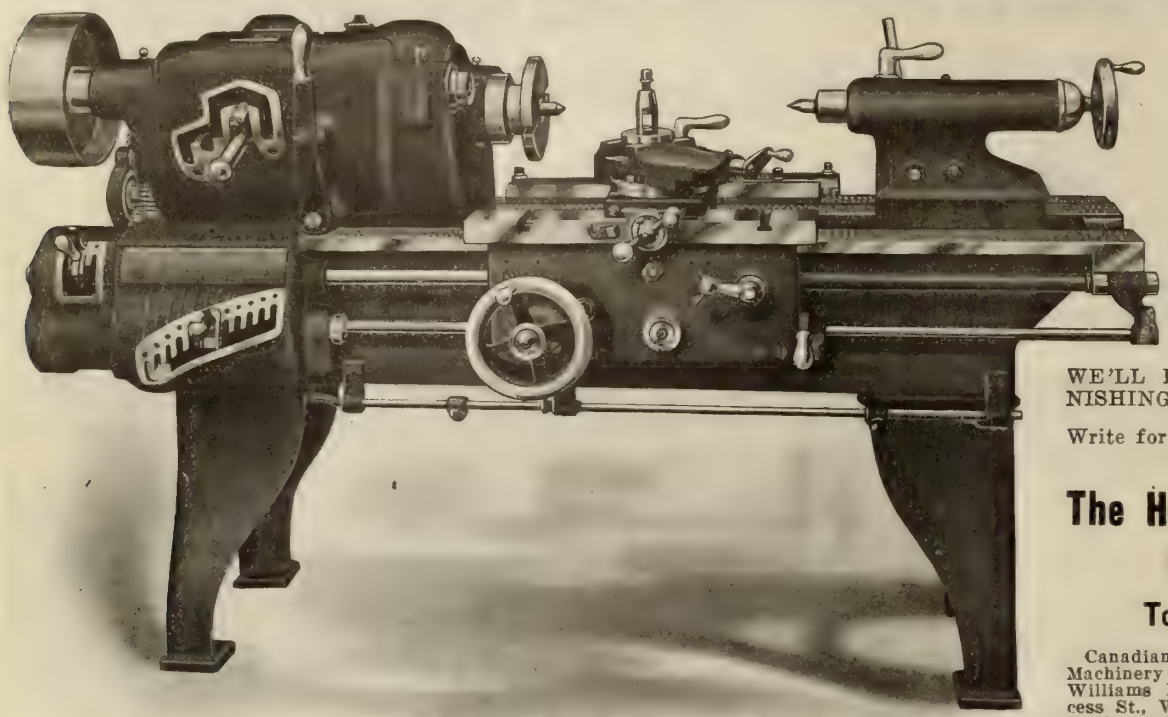
Corner Larned and Third Sts. DETROIT, MICH.

BRANCHES

WINDSOR, ONTARIO, 20 PITT STREET
INDIANAPOLIS, IND., 138-140 SOUTH DELAWARE STREET

# HENDEY 18-Inch GEARED HEAD LATHE

*8 mechanical changes of speed for spindle with driving shaft running at constant speed, 4 direct and 4 through back gears.*



36 DIFFERENT THREADS AND FEEDS are had through **Mounted Change Gearing, each** change being quickly made through controlling handles in Gear Boxes.

BEFORE PURCHASING A NEW LATHE INVESTIGATE THE HENDEY SERVICE.

WE'LL HELP YOU BY FURNISHING LIST OF USERS.

Write for descriptive circular.

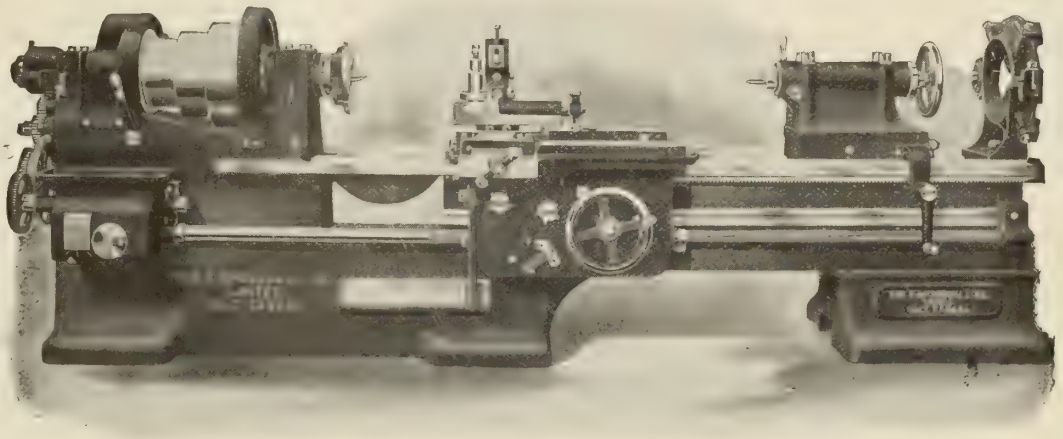
## McDougall Gap Lathes

—

**Strength**
**Accuracy**
**Quality**



Take a look at the next money you intend to invest in a Lathe.
Then, take a look at the money's worth we offer you in our machine.
Your money will soon come back to you in increased production and we will have the pleasure of having a satisfied user. Our machines are just as good as they look and they look good too.
We invite the closest inspection.

ARE-MAC-DEE IS A GUARANTEE

**Particulars on request.**

## The R. McDougall Company Limited

**Manufacturers**
**GALT, Ont., Canada**
**The Canadian Fairbanks-Morse Co., Limited, Sales Agents.**

*Little Giant*

## CYLINDRICAL LIMIT GAGES

For shell work this style of gage is most efficient and economical.

**PROMPT SHIPMENT.**

We maintain a large stock at all times.

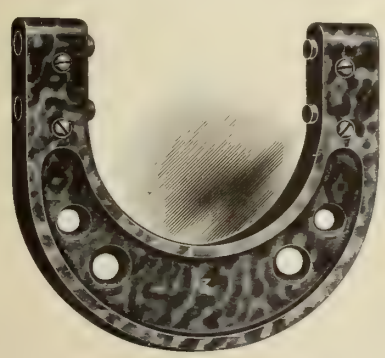
These can be shipped set to special limits specified by the customer within **48 hours** from receipt of order.

Gages set to special limits and with setting plugs can be shipped in 7 to 10 days.

**THREAD LIMIT GAGES.**

For every form and style of screw thread.

Send for our Gage Catalog.



The upper points are set in maximum limits — the lower points to minimum limits. Points can be sealed to prevent tampering.

## Wells Brothers Company of Canada, Limited

**GALT, ONT.**

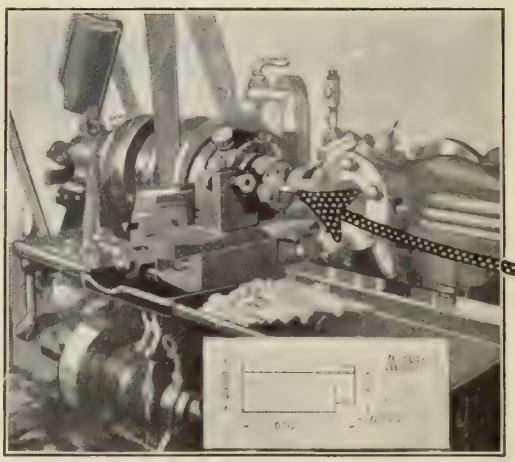
**Sales Agents:**
The Canadian Fairbanks-Morse Co., Ltd., Montreal, Toronto, Vancouver, Winnipeg, St. John, Calgary.

# An Interesting Story about this "Detroit" Quick-Twist Drill

## A RECORD TEST ON SMALL DRILLS

Drilling deep holes in the automatic screw machine is a difficult proposition because of the fact that the drills generally become dull quickly and do not produce a straight hole in the work, or else the drill breaks. Even under the most favorable circumstances, it is difficult to produce a straight hole of any depth with one drill, and the general practice is to use two or more drills in the turret and only drill a short distance—from two to five times the diameter of the drill—until the full depth of the hole has been reached.

An interesting experiment with small drills was lately made in the plant of the Atlantic Mfg. Co., Bridgeport, Conn., on a No. 00 Brown & Sharpe automatic screw machine. The stock being drilled was 17/64 inch cold-rolled steel, which was rotated at a speed of 2609 R. P. M. The depth of the hole in the piece, as shown by the illustration, was 5/8 inch, and the diameter of the drilled hole was No. 30—0.125 inch. The drills which were found to give the best results were those made by the Detroit Twist Drill Co., Detroit, Mich. Four of these Detroit high-speed drills, as shown, were held in the turret in standard Brown & Sharpe floating holders. The first, which acted as a center drill, was fed in to a depth of 0.187 inch, at a feed of 0.005 inch per revolution of the work. The second drill was fed in to a depth of 0.312 inch, at a feed of 0.005 inch per revolution of the work. The third



No. 00 Brown & Sharpe Automatic Screw Machine on which the Drilling Test was made

drill was fed in to a depth of 0.070 inch, at a feed of 0.005 inch per revolution of the work, while the fourth drill was fed in to a depth of 0.070 inch at a feed of 0.005 inch per revolution of the work.

It will be noticed in looking over this list that the second drill was fed in a much greater distance than the last two drills. The reason for this is that as the depth increases, greater difficulty is met with in getting rid of the chips, and the feed must be decreased as the depth increases to secure a straight hole. A most remarkable feature about this test was the length of time that the drills stood up without regrinding. The machine was stopped after 50,000 pieces had been turned out and the drills were still in good condition. It was also found that the most severe duty came on the drill that penetrated 0.312 inch into the work, as would reasonably be expected.
